

AUSTRALIA'S LEADING MASONRY MANUFACTURER

Adbri produces an innovative range of architecturally inspired concrete products for use in all residential and commercial landscaping applications! This premium range of concrete pavers, retaining walls, garden edging and land stabilisation products are proven performers and can be used to enhance your home!

Pavers are the foundation to an Outdoor Room and with designer varieties for patios, courtyards and entertaining areas, there is an Adbri paver for every home paving project. Adbri also produce the Euro® Paving System, Australia's premium pavement solution which features high quality pavers available in a range of textures and finishes.

Retaining Walls and garden edging are key components to any outdoor area and can add depth, dimension and enviable aesthetics to gardens. These segmental block walls are also perfect for reclaiming sloped land, creating terraced gardens, planter boxes, veggie patches and DIY friendly retaining walls.

Adbri has a paving, retaining wall or garden edging solution to every landscaping project!

PAVER CARE

PAVING ADVICE

For in depth paving advice, tips and hints please visit our DIY centre at adbrimasonry.com.au/diy or download the CMAA Paving Maintenance Guide from cmaa.com.au.

SEALING

If the pavers are to be used around a swimming pool, or exposed to salt water then Adbri Masonry strongly recommend sealing your paving. We recommend you do this for aesthetic and maintenance purposes, not for structural reasons.

Products	Type	Size (mm) l x d x h	No. per m ²	No. per tonne	No. per pallet	Colours

MAINTENANCE

Pavers will require some ongoing maintenance to keep in a pristine condition. Dirt, dust and leaves should regularly be removed whilst any weed growth should be sprayed and controlled.

CLEANING

All pavers will require cleaning from time to time. Oil, rust, efflorescence and other stains can detract from the appearance of the paver. Proprietary cleaning products for concrete pavers (and retaining walls) are readily available.

PAVER INSTALLATION GUIDE

Adbri Masonry Pavers can be laid by two methods; Rigid Installation (with a concrete basecourse) or Flexible Installation (a granular basecourse). Properly constructed rigid pavements can be more stable where soil conditions are poor, (e.g. reactive or poorly drained clay).

Drainage is most important for a successful paving project. Care must be taken to grade the basecourse and the finished pavement level at a minimum gradient of 2% (or 100mm per 5.0 lineal metres). Refer to the CMAA's PA05 document for further drainage details.

The laying of pavers on a sand bed on a concrete slab is not addressed in this

brochure. It can be done, but efflorescence staining can occur on pavers laid in this manner if there is inadequate drainage of the concrete slab.

For further information please refer to: Adbri Masonry Paving Installation Guide at adbrimasonry.com.au and Concrete Masonry Association of Australia (CMAA) Guidelines at www.cmaa.com.au: PA02 Concrete Segmental Pavements - Design Guide for Residential Accessways and Roads, PA05 Concrete Flag Pavements - Design and Construction Guide.

Note: The following is a guide only and in no way replaces the services of a professional design consultant.

FLEXIBLE INSTALLATION

Step 1. Excavation: Excavate your area to allow for a granular* basecourse, (75mm for pedestrian traffic and 175mm for driveways after compaction), plus 20-25mm of washed coarse bedding sand plus the thickness of the paver.

Note: Pavers for driveways should be at least 50mm thick.

**Class A road-base or 20mm graded crushed rock are suitable materials.*

Step 2. Compact the Basecourse: Place the granular basecourse to the desired depth and compact using a vibrating plate machine. Ensure your basecourse is firm and of uniform thickness. If the area needs to be built up then do so in compacted 75mm layers. Up to 5% of cement can be blended in to the granular basecourse for more stability if required.

Step 3. Bedding Course: Spread clean coarse bedding sand over the compacted basecourse to a depth of 20-25mm and screed to a flat even surface.

Step 4. Lay the Pavers: Begin laying pavers from one corner, utilising a string line to keep the lines straight. Don't walk on the sand, walk on the pavers already laid.

Step 5. Edging: Edge restraints are essential to prevent lateral movement of the paved area and must be installed prior to the application of the jointing sand. Refer to the Edging section for details.

Step 6. Joints: Adbri Masonry pavers in this application should be laid with a 3 - 5mm gap. Fill this joint with a fine washed sand or specialised jointing sand as the paving proceeds. This will minimise movement in the pavers when compacting.

Step 7. Final Compaction: To compact the pavers place a flat heavy board across the pavers and hit with a rubber mallet. For pavers of 50mm depth or greater, a vibrating plate machine should be used for the best results (more jointing sand should be added as pavers are compacted). It is recommended a piece of carpet be placed under the plate to protect the pavers from chipping.

Flexible Installation

RIGID INSTALLATION

Step 1. Excavation: Excavate your area to allow for a 75mm thick, (or 100mm for a driveway) concrete slab, (rough screeded 20MPa grade with SL82 reinforcement at 30mm and contraction joints at 3 metre centres), plus 15-25mm of mortar plus the thickness of the paver.

Note: Pavers for driveways should be at least 50mm thick. The concrete should be wet cured for at least 7 days before laying. 100mm driveway slab is only applicable for vehicles <1.5tonne. Any vehicle loads exceeding this will require an independent slab design to be completed.

Step 2. Apply the Bond Coat: Prepare a cement slurry by mixing 6 parts fine washed sand to 1 part cement. Apply a thin coat (about 1mm) to the working area of the slab with a broom and to the underside of each Adbri Masonry paver just prior to laying.

Step 3. Lay the Pavers: Using a string line to keep the lines straight, lay the pavers on a wet mortar bed of 15-25mm thickness. Mortar should be mixed at a ratio of 3 parts washed concrete sand to 1 part cement. Do not make the mortar too wet. The mortar should be stiff enough to make a fist sized ball which holds its shape. Pavers should be laid to form a smooth finished surface by using a level and lightly tapping with a rubber mallet.

Note: Do not add extra water to retemper any stiffening mortar. Make a fresh batch instead; enough to last 30 - 45 minutes laying.

Step 4. Joints: Adbri Masonry pavers should be laid with a 3mm-10mm joint between the units. Joints 3mm-5mm in width shall be filled with a jointing sand. For wider joints, it is recommended that a non shrink grout be used.

Notes: Do not bridge pavers over the contraction joints in the concrete. Pavers must be cut and the joints filled with a flexible compound as per Engineers specifications. If any mortar is spilled on the pavers during installation remove immediately using a clean sponge and water. Do not traffic finished pavement for 72 hours.

Rigid Installation

PAVER CUTTING

You will generally find that some cutting of pavers will be required to fit into specific areas. An angle grinder with a masonry blade is suitable for good results. On jobs where a high number of cuts are required or the paving units are large, it is easier to hire a brick saw with a diamond blade - remember ear muffs, eye protection and a mask.

EDGING

It is important to have a good edge restraint to stop the pavers from spreading and to ensure that the bedding sand is not washed away. Here are two general techniques.

By embedding a paver on edge in concrete

By embedding the outside paver in concrete to approximately half the height of the paver and back filling with suitable garden material

SWIMMING POOLS

> Adbri Masonry pavers meet Australian slip resistant standards, making them ideal for swimming pool surrounds.

> Adbri Masonry pavers while being strong and durable have a soft feel, making them comfortable under bare feet or for sitting along pool edges.

> Adbri Masonry manufacture some pavers specifically for salt resistant applications, necessary for around salt chlorinated swimming pools. This range varies between States so please consult your local Adbri Masonry distributor or Adbri Masonry product guide for specific localised advice.

> Adbri Masonry recommend sealing pavers likely to be subjected to salt attack.

MAINTENANCE

Pavers will require some ongoing maintenance to keep looking in a pristine condition. Dirt and dust should regularly be removed whilst any weed growth should be sprayed and controlled. Ants should not be allowed to nest in base materials.

CLEANING

All pavers will require cleaning from time to time. Oil, rust, efflorescence and other stains can detract from the appearance of the paver. Proprietary cleaning products for concrete pavers (and retaining walls) are readily available. Please contact your local distributor or Adbri Masonry for further information. Do not use Hydrochloric Acid.

SEALING

If a more protective surface is required then Adbri Masonry suggest you seal your paving. There are a number of sealers specifically for concrete paving so please contact your local distributor or Adbri Masonry for further information.

Note: All coloured product should be ordered at the one time to reduce the risk of batch variation. No claims will be accepted once product has been installed.

How many pavers will you need? Using the helpful diagrams below, measure the desired space you would like to pave. This will give you a total square meter figure (Length(m) x width (m) = area (m²)).
TIP: You can check out the paving calculator at www.adbrimasonry.com.au/calculator to see how many pavers you will need for your area.

For rectangular areas

$$\text{base(m)} \times \text{height(m)} = \text{area(m}^2\text{)}$$

$$\text{eg. } 3\text{m} \times 5\text{m} = 15\text{m}^2$$

For triangular areas

$$1/2 \times \text{base(m)} \times \text{height(m)} = \text{area(m}^2\text{)}$$

$$\text{eg. } 1/2 \times 3\text{m} \times 4\text{m} = 6\text{m}^2$$

For odd shaped areas - break into sections

$$\text{Area 1: } 4\text{m} \times 3\text{m} = 12\text{m}^2$$

$$\text{Area 2: } 6\text{m} \times 3\text{m} = 18\text{m}^2$$

$$\text{Area 3: } 1/2 \times 6\text{m} \times 2\text{m} = 6\text{m}^2$$

$$\text{Total area to be paved} = 36\text{m}^2$$

The easiest way to work out which corner block you require is to use your hands!

- Hold hands up as per diagram on left
- Your index finger is the face edge of the block
- Your thumb is the return of the block

So if the block you require looks like the orientation of your left hand then the corner unit you need is a Left Hand Corner Unit, and visa versa.

RETAINING WALL RANGE

AB® Courtyard

Complete a simple weekend project with this new pure vertical, double sided walling system. With a natural split face texture and so many DIY project opportunities, AB® Courtyard will enhance your home!

For maximum non reinforced wall heights please refer to cross sections on pages 44-45

TYPICAL CROSS SECTIONS

AB® COURTYARD CROSS SECTION

Max 300mm (2 units) high for gravity retaining walls. Build free standing walls to 750mm and piers to 900mm when not retaining.

VERSASTONE® CROSS SECTION

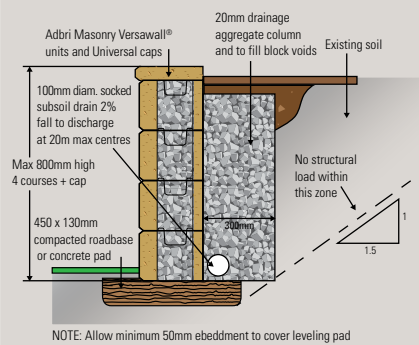

NATURAL IMPRESSIONS® CROSS SECTION

WALLSTONE® GRANDE VERTICAL CROSS SECTION

VERSAWALL® CROSS SECTION

VERSAWALL® NO FINES CONCRETE CROSS SECTION

NOTES

- All cross sectional diagrams are not to scale
- All retaining walls are designed to CMAA document .MA53 (Segmental Concrete Gravity Retaining Walls Design and Construction Guide).
- All retaining walls shall comply with AS 4678 Structure Classification A.
- These diagrams are only applicable to retaining walls that incorporate an impermeable surface membrane and drainage system such that there can be no ingress of any water into the soil behind the retaining wall.
- These diagrams are applicable to cuts in situ soils. The diagrams are not applicable to cohesive fill.

LAWN EDGE CROSS SECTION

TORPEDO™ BASE BLOCK CROSS SECTION

NOTES CONT.

- All retaining walls are designed for an imposed surcharge load of 2.5 kPa. If imposed loads greater than 2.5 kPa are expected, these designs will not be appropriate.
- Levelling pad: a levelling pad may consist of compacted material (5% cement stabilised crushed rock) for wall heights up to 800mm. Walls over 800mm high must use 20MPa concrete for the leveling pad.
- This design information is a guide only. For walls exceeding the nominated heights as above, please refer to the Retaining Wall Systems Technical Brochure. Walls exceeding maximum heights shown will need to be designed and certified by a qualified engineer. Please consult your local council to confirm if you require council approval for your proposed retaining wall.

DIY with Adbri

1

CHOOSE PRODUCT

Select a retaining wall product by browsing through this catalogue or searching online at adbrimasonry.com.au.

2

CALCULATE QUANTITY

Calculate the amount of retaining wall blocks you require with our easy online calculator. Visit adbrimasonry.com.au

Order 5% more for every project to account for cuts and breakages.

3 Simple Steps ...

3 BUILD YOUR WALL
