Disclaimer: This report is published by NZX Rural Limited ("NZX Agri") for your information only. This report does not constitute an offer, solicitation or recommendation to acquire or dispose of any investment or financial product. No part of this publication may be redistributed or reproduced in any form or by any means or used to make any derivative work without written permission from NZX Agri. NZX Agri (including its group companies and each of their directors, officers, employees and contractors) shall not be liable (except the extent strictly required by law) for the use of the information contained in this report, however arising. This report is published with due care and attention, but NZX Agri and its group companies accept no liability in relation to the completeness, accuracy or timeliness of this report and its contents. The PGI is calculated with input from New Zealand-wide climate stations. Dairy land is selected, and a milk production weighting applied to build National, North and South Island aggregate PGI values from 17 Dairy NZ regions. The PGI takes a value between 0 and 1, where 1 indicates ideal conditions for potential grass growth and 0 means no growth potential. The NZX Dairy PGI system has been integrated with a 15-day ensemble forecast system based on state-of-the-art numerical modeling. 12-month subscription from \$2000.
