I am a local Stock and Station agent and also a 3rd generation farmer from the Coonamble region from which our entire livelihood relies solely on GAB water for my domestic and business use.

I write this submission because I consider the management of the GAB to be critically important now and for all future generations who will follow me living and relying on this amazing resource. My concerns with current GAB use include:

- The number of uncontrolled bores and open bore drains - funding should be made available to continue with the Cap and Pipe of these
- Maintenance of bores and infrastructure should be a priority for the future of the GAB - funding needs to be made available as above, to not only continue with the Cap & Pipe Scheme but to maintain those already done so they continue to improve water take and wastage.
- The stress to the GAB from increased mining approvals - particularly around or on recharge zones of the GAB. Why are we considering allowing further take from the GAB when the draft mentions in several places that the resource is both finite and in some cases already stressed. Mining anywhere near the GAB should not be allowed in my opinion.
- Regulations and compliance on water take and use are not regulated under one body - each state has their own governance - I feel it would be much simpler, more transparent and better for the management of the GAB if one body independently elected could monitor and regulate the GAB moving into the future. Not self-regulated, one rule for all users, and transparent for the general public as well as industry and government.
- I believe we should adopt and adhere to the Precautionary Principle regarding the further use of the GAB into the future - if an industry cannot prove they will not adversely damage or destroy the GAB then it must simply not be allowed to proceed - protection of the GAB must be the top priority of any management strategy - we cannot sustain continued agriculture (food production as a priority) nor life without the GAB - it must be protected at all costs.

I hope to see the consultation proving effective, with suggestions adopted from submissions along with continued transparency in the management of the GAB - a natural resource we simply cannot afford to place under stress, nor contaminate in any way. As a person/family reliant on the GAB as my/our sole source of freshwater I/we urge you to carefully consider the impacts from increased mining approvals on and around the GAB - we simply cannot "make good" irreversible damage and for me/my family & I - we cannot sustain life in this area without it. It really is our lifeblood!]

Regards,

Angus Chadwick
