

Take off

When everyone has boarded the plane the cabin crew prepare the plane to take-off. Take-off is when the plane drives down the runway and then flies into the air.

The Cabin Crew will close the doors and check that the overhead lockers are closed.

I will need to sit in my seat and fasten my seatbelt. This is important to keep me safe whilst the plane is moving.

I will need to keep my chair upright, the window shade up and my tray folded away. I can try to ask someone for help like the plane staff or my family.

I will need to put my iPad or phone to airplane mode. This helps the plane computers work.

The cabin crew will stand up and show us the safety procedure. People try to listen to the safety demonstration so they know what to do in an emergency.

The plane will then start moving down the runway. Sometimes we might have to wait for other planes to take off before our plane can leave.

When it is our turn the pilot will tell the cabin crew to sit in their seats and prepare for take-off.

The plane will start to go faster down the runway and go up into the air. It might make a loud noise and it might make my ears feel different. This will only last a short time.

I might look out the window as the plane goes up.

Once the plane has reached the right height it will fly in the direction of our destination.
