INFLUENCE

HOW TO EXERT IT

By YORITOMO-TASHI

ANNOTATED BY B. DANGENNES
AUTHORIZED EDITION
TRANSLATED BY DORA KNOWLTON RANOUS
AND HERBERT G. WINTERSGILL

*The mastery of the Art of Exerting Influence is the
greatest element of Success*

FUNK & WAGNALLS COMPANY
NEW YORK LONDON

ANNOUNCEMENT

YORITOMO-TASHI, whose precepts are presented in this book, ranks as one of the three greatest statesmen that Japan has ever produced. He was the reviser of the Empire's code of laws, and the organizer of military feudalism, he rescued his native land from the slough of demoralization into which it had sunk. In 1186 he established the seat of his government at Kamakura, where he organized an administrative body similar in its methods and operation to the metropolitan government. From what is known of his public career, it is evident that he exercised a dominant influence over the minds of his people. To him the art of influencing others was the key to Success.

In the lessons that Mr. B. DANGENNES has drawn from the writings of Yoritomo-Tashi, and presents in this book, the manner in which Influence may be exerted and the means by which it may be exercised are considered.

THE PUBLISHERS.

TABLE OF CONTENTS

- By Persuasion
 - The Influence of the Eye
 - Through Clearness of Speech
 - By Setting Good Example
 - By Decision
 - By Rational Ambition
 - By Perseverance
 - By the Prestige Gained from Concentration
 - By Confidence
 - Acquisition of Dominating Power
-

BY PERSUASION

PERSUASION, Yoritomo taught us, clothes itself in two very different forms; the one invades the soul like the invisible molecules of a soothing balm poured from a kindly hand, and gently infiltrates itself throughout our systems, communicating to us its virtues.

The other may be compared to the terrible wind of the African deserts. If, from the first hour one feels its burning touch, he has not known how to avoid it by shutting himself closely within his dwelling, every crevice and opening of which has been sealed, nothing can escape its attacks. The imperceptible sand drifts little by little into all corners of the house, and even reaches all parts of the human body. However well protected we may be, it even penetrates closed lips and eyes, and soon this almost invisible thing seizes on every man and becomes his constant preoccupation.

Evil persuasion is all the more dangerous because it knows how to clothe itself with the most attractive external attributes. That is what we meet in the guise of counselors whose words are always tempting, since they adopt the false appearance of solicitude. With earnest words and sympathetic smiles, these persons who almost always have nothing to do in life, try to spoil the lives of others without having a suspicion of their unconscious crime.

Usually these are the kind of persons that talk in apparent good faith about the freedom to live one's own life. They are those who seek the agreeable sensation of the moment, without giving a thought to the possible bitterness of

tomorrow.

They have to learn harsh lessons, for all that; often they are compelled to suffer for days and weeks in order to pay for one day of careless pleasure; but these days are either soon forgotten, or their lightness of character is such that they prefer to take the risk of drawing down on themselves serious troubles in the future than to make any effort in the present to avoid them. Here Yoritomo, always ready with examples, related the following story:

I once knew a young man, the son of one of my friends, who was afflicted with a certain lightness of judgment. He was not bad at heart, but his effeminacy and lack of strength of will made him an undesirable companion for such of his young friends whose souls were not sufficiently tempered by the practice of a continual appeal to dominating forces.

One day he was calling on one of his friends, whose father occupied an important place in the senate, and who sent his son to the house of one of his colleagues to learn the result of a discussion in which he had not been able to take part. Apropos of a very important question, on which a favored future or a disgrace depended, he wished to know what a night session of the senate had determined.

On the way, the son of the senator confided his apprehensions to his frivolous friend. To this young man these weighty matters seemed unimportant and childish, and he dwelt much on the bore it would be to allow this matter to spoil an evening in which both friends had promised themselves much pleasure.

His reply filled the senator's son with consternation; the night session had taken place, and the most important affairs had been discussed, and the absent senator had been attacked with great bitterness by his adversaries.

But the friend said, 'Since the *contretemps* is sure to bring trouble and spoil the pleasure we were looking forward to, why risk this trouble? We can tell your father that the session did not take place, and that all is going well!'

The senator's son resisted; he would not dare lie to his father, he said. But his friend became more insinuating: 'It would not be a serious lie, and besides, one would have time to say that some one had misunderstood—in fact, are we quite sure that there had not been some misunderstanding ?'

In order to vanquish his friend's last hesitations, the young gentleman pretended to recall the whole interview, analyzing its details and inventing others. Meantime, he said, they would say that several persons had stopped them and questioned them; was it not to one of these that they had replied?

He said so much in so persuasive a way that at last the senator's son deliberately told his father that the expected session had been postponed until the following day. Under the influence of this evil persuasion he felt not the slightest remorse in telling this falsehood, and passed a delightful evening.

But alas! the next day must have been terrible!

His father and his partisans could not be found at all in time to foil the scheme of his enemies; his disgrace was decided on, and the order to commit hara-kiri was sent to him.

After he was dead, his effects were confiscated, and his son dragged out the miserable existence of the poor beings whom will and dignity do not console.

The old philosopher did not tell us whether the friend, the cause of all these disasters, sought to palliate them by coming to the aid of him whom he had ruined by his detestable counsel. But it is probable that, feeling in this affair as those feel who are conscious of their contemptible conduct, he looked on indifferently at the misfortunes chargeable solely to his own lightness of character.

It is, in fact, a common trait with those who are conscious of their own inability to make the least effort to experience a wicked sort of pleasure in observing the failure of others. Another variety of the agents of bad persuasion are those persons we call pessimists, whom Yoritomo describes thus:

One should flee those who are created with life which makes one think only of the stupor of death.

Their souls are always in the state where one finds the body in the tomb; every effort seems useless to them, or rather, they prefer to make a show of that indifference which makes the gestures necessary to obtain the accomplishments they pretend to despise.

Despise them, indeed? Do they not feel,

rather a malicious joy in demoralizing others?

They like to consider man as fundamentally bad, and to declare that the slumber of the dead is the superior of all other pleasures.

That is true only regarding those who, as we have said, pass through life as if they were already dead. They would be right, perhaps, if one heard only through pleasures of the gross, earthly joys of existence. But, for those that know how to see the joy of living is in all things, and we can taste it, even in the midst of the greatest afflictions. Can the grief of mourning, cruel though it may be, prevent us from admiring the sunshine at the moment when it hangs the purple of the sunset in the sky before it sinks to sleep behind the quivering birch-trees?

Can any grief, whatever it may be, prevent us from feeling a delicate emotion on hearing the sweet, strong voice of a boatman, whose song is lost in the distance when his light craft disappears in the golden mist of the great lakes. The joy of life throbs everywhere about us;—it is in everything that surrounds us, and we should gather all our strength to cry out against those that preach pessimistic doctrine, for every life, sad though it may be, is worth living. Do we not hear those that talk about the scourge of our day, neurasthenia—which often is only one of the commonest forms of egoism for those that are attacked by it—refuse not only to believe in the beautiful and the good, but they devote the last sparks of their fast disappearing will to persuading others of the uselessness of everything.

Are they always sincere? Do they not do this in a sort of spite against those who are more

expert in the art of living and who excite their envy by enjoying the blessings of life which their own moral weakness does not allow them to appreciate.

How much happier are those of whom Yoritomo says, They accept joyfully the evil of living, and show it in their fervent adoration of everything that is beautiful and good. These, he added, are the true priests of favorable persuasion. They know by the authority of their own conviction, how to give courage again to the weak and faith to the incredulous.

By the virtue of persuasion, they banish from the invalid the pains which almost always hasten the apparition of imaginary sufferings. They know the right words to say to strengthen weak wills, and to give to those who suffer pain in reality the courage to support the ills which sympathy and solicitude made lighter. They are, in short, true healers.

The persuasion toward health is the best of panaceas, for no one denies the influence of moral qualities on physical health.

I once knew a man who, under the influence to one fixed idea, was about to die.

He imagined that, while drinking the water of a stagnant pool, he had swallowed a serpent, minute at first, but which growing larger inside of his body, caused internal ravages of which he felt himself likely soon to die.

His friends had told me of his singular ease, telling me how anxious they were at seeing this so-called invalid wasting away day by day.

I was curious to visit him; I found a real invalid, looking very ill, with features sunken, and hardly able to drag himself about. Press-

ing his chest, he told us that the serpent was devouring him.

His friends laughed at him and seemed to think that I would join them in their mirth, but I judged the moral evil too serious to try to soothe him by trying to reason with him. Persuasion alone, based on a real or an imaginary proof, with the aid of suggestion, could save the man.

Instead of laughing with the others, I pretended to believe that he was really ill, and asked him to tell me his story, to which I listened with the deepest attention.

To his great astonishment, I sympathized with him in his trouble, and spoke of one of my friends, a famous healer, who would be happy to interest himself in the invalid and to try to save him.

Two days later I returned, actually bringing with me a physician whom I had told of this strange mania, and who had promised me his assistance, for it was indispensable to have near me some one who could speak authoritatively in order to impress the mind of the invalid. He examined the patient carefully, prescribed certain medicines, and withdrew, without giving any words of positive hope. Then began my part, that of a psychologist. I pretended that I would tell him the absolute truth, however brutal it might seem. The doctor had discovered beyond all doubt the presence of the serpent; he had tried certain medication. Would it succeed? He dared not affirm it.

Several days passed, with alternating fear

and hope, which indications I noted carefully. Finally, one day the physician declared that he was about to make a decisive test, of which he had great hope of a favorable result.

I had known so well how to be persuasive, and had understood so thoroughly how to surround the patient with the right occult influences, that he no longer rejected the idea of a possible cure; and when, after taking certain medicines that induced him to vomit freely, we showed him the serpent which he believed he had thrown up, our invalid found himself suddenly cured.

After this, if he happened to feel again pain or discomfort of any kind, he attributed it to the ravages caused by the serpent, and, as the cause existed no more the evil soon disappeared.

This case shows that one of the conditions of succeeding in the art of persuading is not to batter rudely at convictions that one wishes to uproot.

This hardly requires an explanation; in order to persuade some one it is necessary to merit his sympathy; now, one never gains the sympathy of those whose opinions he does not share.

Hence, in order to persuade successfully, one must banish suspicion and know how to listen. One must not forget the profound egotism that characterizes all imaginary invalids; they are so full of themselves that their ills seem to them to acquire high importance.

They can not admit then that the whole world is not interested in their aches and pains, and the importance they themselves attach to them is a subject of development for their

malady.

For it is incontestable that all moral emotion has an immediate repercussion on the physical state.

To be able to persuade a patient that he is cured is, in most cases, to free him from his malady; it is always infinitely attenuated, since it is to spare him moral uneasiness, too fruitful mother of bodily ills.

But Yoritomo did not stop here with instructing us in the benefits of persuasion; he extended his remarks to the unfortunates who are assailed by the doubt even of happiness, and he encouraged them with this parable:

A young lord was passing one day along the highroad when his palanquin was struck so roughly that it was broken to pieces; he looked at the ruins a moment, then he ordered his bearers to go in search of a new one, and sat down by the roadside to wait for them to bring it. A poor man passing by stopped and talked with him about the accident.

And what shall you do with these pieces? he inquired. Why, nothing, the rich man replied; I shall leave them where they are. Then will you allow me to take them? Yes, since I don't want them. The beggar then set himself to work; he re-adjusted the boards, washed the soiled spots on the hangings in the nearest brook, and did so much and so well that toward evening the palanquin, although a little deteriorated, it is true, was solid and fit to use again.

Just then the bearers returned. They had not been able to find anything but a palanquin so

light and frail that, as soon as they tried it, they saw that it would not do. There the beggar intervened, and offered 'his' palanquin.

The young lord was glad to pay a large indemnity to have the use for several hours of a thing which in reality belonged to him. And that, adds the old philosopher, is the experience of many persons who will not understand that a destroyed happiness may prove a kind of blessing, if one knows how to gather up the pieces.

Instead of grieving over them and abandoning them by the wayside in order to wait for what may turn up, is it not better to do as the beggar did and to seek in the mishap a security which we should find it difficult to be sure of in the coordination of new events? It is on such occasions as this that the power of influence comes into play. In order to persuade men that it is easier for them to work at the construction (or reconstruction) of the happiness that is near them, psychic power is more necessary than it is in drawing them into hypothetical adventures. Few men are not attracted by the magic of 'beginning over again,' and how many others count on luck, which they almost deify! When can they convince themselves that, for those who know the power of influence, which develops a steady will and a strong thought, luck is born chiefly of circumstances created by ourselves?

Almost always we are the architects of our own fortunes; it is in working at them without respite that we may model them if not wholly according to our wish, at least in a way somewhat approaching it.

It is by believing steadfastly that we shall attain the highest power, that we shall acquire the qualities that make a man almost more than man, since they allow him to govern and subdue those by whom he is surrounded. Might we not say that here Yoritomo presented the superman of Nietzsche, and do we not find in all those theories a commentary on the modern phrase of the power of mind over matter.

In what manner does this evolution produce itself and above all by what means can one obtain these quasi-miracles?

How does one make this effort to attain the desired end, and what qualities, occult or material are necessary to develop to attain this magnificent ambition to conquer the minds of men? Listen to what the Shogun tells us in the following chapters.

THE INFLUENCE OF THE EYES

FEW persons escape the influence of the human eye. If its look is imperious, it subjugates; if it is tender, it moves; if it is sad it penetrates the heart with melancholy. But this influence can not be real and strong unless it is incited by the thought behind it which maintains and fixes that look, in communicating to it the expression either terrible or favorable, persuasive or defiant, which alone can maintain the firmness and the perseverance of the active forces of our brain.

Some persons, said Yoritomo, possess naturally a fascinating eye; usually they are

those who can maintain a steady gaze for a long time without blinking.

But it is not sufficient to be able to throw a glance the persistence of which sometimes causes a passing discomfort, which almost always tends toward the subjection of spirits of the weaker sort.

This look should be the projection of a thought in which the fixed form is definite enough so that its penetrative influence shall become efficacious.

But, some one will say, it is not always necessary to think, since several animals possess this power of fascination, like the snake, which holds a bird motionless under the power of its gaze, so that it never dreams of trying to use its wings to escape from its enemy. But if conscientious thought does not exist in the animal, it is nevertheless active in responding to instinct.

There is a blind force in the brain of the serpent, which nevertheless is very strongly accentuated, and which turns it from taking possession of its prey, and this force, mastered by a powerful instinct, determines a compulsion which in the weaker creature is sufficient to paralyze all inclination to resist.

But the serpent does not monopolize this privilege of fascination, if one may believe certain old French chronicles.

In the old book published by Rousseau in the seventeenth century, it is related that a toad shut up in a vase that he could not get out of found it difficult to endure the fascination of

the human eye; at first, in evident uneasiness, it tried to escape; then, when convinced that that was impossible, it would return to its former position and stare at the person in its turn, and ended by dying of the effect of this peculiar force.

Is it necessary to lend strength to this story by adding that one day a toad, stronger or more irritable than the others, riveted its eyes so long upon a man's eyes that he actually felt the influence of the creature and swooned under the implacable fixity of its gaze?

I do not believe that such experiences have been officially established, but it is none the less interesting to conclude that if under the sway of an instinctive thought, the eye of an animal can acquire a rare power, the eye of man, when he is animated by an active and reasonable thought, may be an important agent of influence and of suggestion.

In order to convince an adversary, said the Japanese philosopher, one must look him straight in the eyes.

But it would be very stupid and unskilful to employ this method without discretion. Some would see in it only insolence, and their irritation would prevent them from feeling the full influence of the gaze; others would feel a certain uneasiness which would cause them to turn the eyes away before having submitted entirely to the gazer's influence, and might prevent them from renewing an interview with a person that had impressed them so unpleasantly.

The best way to begin the use of the eye in influencing is to talk of subjects that will not

arouse suspicion in the interlocutor.

One should present himself in an easy and quiet manner and listen without showing any signs of impatience to whatever objections the person may make; some of these may not be lacking in accuracy, and it would be unwise to combat them.

It is unnecessary to add that the least hastiness, which would displace the point of concentration of the thought, would be injurious, and might work serious harm to the success that we seek.

Too great excess of modesty should be avoided, for the transmission of thought—and consequently of influence—is worked at our cost. Timidity is always an obstacle to the influence of the eye, which should, at the very first interchange of glances, look straight and frankly into the eyes of the interlocutor, at the top of the bridge of the nose.

The first conflict once over, one should turn away his eyes carelessly; especially he should avoid the eyes of his opponent (as we will call him) in the first minutes of conversation, before your own have gained any hold on him; one should in some way fix his gaze without allowing his eyes to gain a hold over your own.

In short, he who wishes to influence another by his look, must take the greatest care not to let him suspect his design, which would immediately put him on the defensive and render all your efforts vain.

I once knew a young man named Yon-Li, added Yoritomo, who went to call on a *Daimio* with the intention of serving as a mediator

between him and one of his friends.

In strict truth, I should say that the object of this proceeding was not wholly disinterested, since he wished to urge the *Daimio* to conclude a transaction that was injurious to his own interests.

Besides, the friend had promised a round sum to Yon-Li if he should succeed in influencing this important personage to the point of accepting this solution.

For a long time the young man had practiced exercises in the development of psychic influence, and he believed that he had arrived at the point when one is sure of himself. He entered and immediately threw on the *Daimio* a glance which the other thought rather singular; he tried to surmise the cause of a look which became almost aggressive in its expression of determination to dominate him. He was a man of strong will, who had for a long time exercised his powers of penetration. He had no great difficulty in discovering the motive that actuated the young Yon-Li, and he conceived the idea of fighting him with his own weapons.

Taking care to avoid looking into the pupils of his visitor's eyes, he fixed him in the way which we have described, concentrating his gaze at the top of the bridge of the nose and strongly centering his thought on the idea of domination. The young amateur was not prepared to meet an attack more powerful than his own; his bold assurance faltered a little; under the influence of that penetrating look he blinked, lowered his eyelids, and gently turned away. Ho was vanquished, and it was with hesitation that he made his request. It was not enter-

tained or even listened to, and he had besides the embarrassment of confessing, despite himself, the indelicate step which he had been ready to undertake.

Yoritomo added:

The influence of the eye is undeniable; it is occult power set in vibration by the force of the thought; it is the result of the action of the forces that surround us, combined with our own vital force.

One should not use these forces by chance. It is well to use them, especially, as arms, offensive or defensive, in the great battle won by wisdom and a knowledge of human nature. But just as when he instructed us in the acquiring of energy, as well as when he taught us how to overcome timidity, Yoritomo did not content himself with uttering precepts; he told us the methods whereby we might acquire the precious gifts that he extolled.

In order to attain that authority of the eye which is one of the first conditions in the study of acquiring mental dominance, said Yoritomo, certain exercises are necessary:

For example, it is well to lay a stick of bamboo across a sheet of vellum, and then seat oneself at a few steps' distance and stare fixedly at the bamboo without allowing the eye to wander to the sheet of vellum.

One must use all his strength of will to avoid blinking.

This exercise should begin with counting up to twenty, then to thirty, increasing the enumeration up to two hundred, which is enough.

When one can perform this first exercise easily, it will be time to pass to another, a little more complicated.

Having made a hole in the sheet of vellum—taking great care to pierce it in such a way as to have the edges of the opening neat and clean-cut, the experimenter now rivets his fixed gaze on this aperture one, two, three minutes, longer if possible.

It is well also to place oneself in front of a bright, smooth surface, preferably polished tin—lacking one of silver or gold—and to seek in it the reflection of his own eyes.

Plunge your gaze into the inmost depths of your eyes; from the beginning this will be a good exercise in compelling the gaze of others to yield to your own.

In this situation, turn the head from right to left, then from left to right, without losing sight of the reflection of your eyes.

This strengthens the muscles of the eyes, and gives one's glance firmness and the desired power. One should avoid winking the eyes and lowering the eyelids, and should practice meeting firmly the gaze of others.

But all these exercises would be in vain, if during the time of this contemplation, you do not know how to concentrate your mind on a single subject.

How much influence could you exercise over others if you do not know first how to master yourself?

Singleness of thought is indispensable during the development of the use of the eye; if it seems

too difficult to keep it fixed on a single point, it would be well to avail oneself of certain means of suggestion, like the following:

First, count up to ten with the simple idea of doing it slowly, and to allow the same space of time to elapse between the uttering of each number.

Secondly, run through the fingers a chaplet of about sixty beads, counting them in a low tone of voice, without losing sight of the point one has fixed on.

One may count at first up to five or to ten; then increase the count, taking care to begin all over again if one finds one's attention has wandered, or that while pronouncing the numbers it has been diverted, if only for an instant, from the single thought that is the object of his purpose.

But this is not all; as soon as one has acquired the desired qualities in the cultivation of the power of the eye, he should begin to experiment with them, and regarding this here is what our philosopher counsels us:

When you have mastered the use of the eye, and have learned how to concentrate the mind, try the ascendancy of your visual power on some person in the midst of a crowd.

First, choose some one whose face indicates a character weaker than your own, and fix your gaze in the back of his neck, with a single thought, which shall invade his mind, haunting him with a desire to turn around.

If your influence is already sufficiently formed, at the end of a certain time you will see him begin to fidget, then to move his head slightly, as if to shake off an importunate thought; finally, he will move his hand to the spot on

which your gaze has been fixed, then, in spite of himself he will turn around.

This experiment may be made on all sorts of subjects, and it will always succeed on condition that you know how to envelop your subject in an intense mental current the action of which will combine itself with the power of your gaze. You can imagine, then, to what extent this faculty may be useful in ordinary circumstances; it is the secret of those we call fascinating persons, whom no one can resist and who know how to obtain anything they desire *by* merely saying what pleasure it would give them to possess the desired object; for they know well that in concentrating the mind strongly on that for which they ask, the mind of their interlocutor, yielding to mental sway, abandons itself easily, especially if the domination of the eye increases this conviction by creating in him a psychic state which compels him to submit to its power.

These precepts were those of that other tamer of spirits, Mahomet, who said:

The effect of the human eye is indubitable. If there is anything in the world that can move more rapidly than fate, it is the glance of the eyes.

From this saying strong superstitions have arisen, against which the Shogun puts us on our guard:

One of the reasons, says he, that militate in favor of the cultivation of the influential use of the eye is the necessity of getting the better of a certain kind of persons who pretend to have inherited occult power from magicians.

A man gifted with a strong will has nothing to fear from these shameless liars; but a sensitive and impulsive person, who does not know how to assert himself and dominate others, becomes an easy prey; and the suggestions of these wretches will soon lead him to dissipate his fortune in answering their stupid requests. Besides, Yoritomo added, those that would wish to use their occult influence to compel others to commit a wrong action would be soon punished by the loss of this influence, which develops itself gently only when actuated by beneficent thought; while they retract and end by becoming annihilated when the uppermost thought is of the kind of which may be said: Evil thoughts about others are rods with which we ourselves shall one day be beaten.

THROUGH CLEARNESS OF SPEECH

THE word is the most direct manifestation of the thought; hence it is one of the most important agents of Influence when it clothes itself with precision and clearness, indispensable in cooperating in creating conviction in the minds of one's hearers.

Were not the burning words of Peter the Hermit the sole cause of the rising of arms for the conquest of the tomb of Jesus?
And was it not especially because that monk believed himself firmly to be moved by a divine will that he knew how to make his belief shared by thousands of men of all classes, poor or rich, who, under the influence of his words, all possess only a single soul, impregnated with sentiments of heroic piety which urged them to dye the sands of Palestine with their blood?
What arguments had this monk found? Only

three words, but powerful words, when one considers the mentality and the peculiar religiosity of that epoch: God wishes it!

God wishes it! These words were the first to declare to the ignorant masses Peter's all-powerful influence. In the eyes of the vulgar, this man who transmitted to them thus the will of the Most High assumed in their eyes the proportions of a divine messenger, a sort of prophet in communication with the Master of Masters, who deigned to dictate to him His orders.

For others, it was to resume debates by an argument without reply; it was to excuse fatigues and privations, and an unknown death under a foreign sky. God wished it! How vain were all other speech after these three words, which bowed all heads under the powerful breath of divine domination, as wheat bends under the tempestuous winds!

Yoritomo speaks as a true sage, then, when he says:

Leaders of souls should not forget this one thing: Too great wealth of words is hostile to conviction."

And, alluding to a Japanese proverb which is very similar to one of our own well-known proverbs, he added:

If speech is like jade, silence is like a diamond. Speech is like a diamond when it is the vibrating form of the concrete thought and when it presents itself in a quiet way, rendering its suggestions familiar and clear by the way in which the orator knows how to present them. Prolific speech is the medium of powerful

thought—of that thought of which we should be master and not slaves.

Speech is the seed, good or ill-omened, which, sown in irresolute natures, may produce either nettles or wheat.

This may be also the 'fixed idea' that is supposed to be implanted in every weak brain. Suppose some one should chance to say to a being endowed with the power of initiative, but with a wavering will: 'You will be good, because goodness is the supreme end of life,' if the order is accompanied by the dominating look of which we have spoken and pronounced in a tone that will impress, there is no doubt that these influences will produce such a radiation as, in spite of himself, would make him feel himself under the influence of good emanating from himself to converge toward his fellows. This may seem very obscure at first, but the brevity and precision of order will implant themselves little by little in his brain, of which the passive forces, always submissive to confused influence, will at a certain moment determine the active forces to emerge from the background where up to then they had lain hidden.

But if one expresses this prophecy some day before a being afflicted with moral weakness: 'You will be a criminal,' the idea, originally repelled with horror, ends by sowing in his brain an idea first of the impossibility of the suggestion, then, more frequently evoked it becomes less monstrous, and he finishes, with a smile of doubt at the beginning, then with fear, by facing the eventuality of this prophesied crime, the specter of which had pursued him so persistently, that one day, when carried away by

anger or a violent passion, he accomplished this criminal act, against the temptation of which he would certainly have reacted, had he not been possessed with the fixed idea which designed him before his own eyes as the instrument predestined by Fate.

That is the reason why, added the Shogun, with infinite wisdom, one can not blame too much such parents as prophesy for their children terrible punishments for reprehensible acts which they can hardly help committing. And he added:

Those who, thinking to cure their children of faults more or less characteristic, repeat to them: 'You will die under the executioner's whip,' are sometimes the involuntary cause of this execution.

To strengthen this idea of so lugubrious a fate for the little ones, they familiarize them with it, and dwell on its horrors.

Then they compromise constantly their authority before their children, for they, seeing them the next day filled with kind feelings and expressing tenderness toward them, will not fail to regard lightly the terrible menace with which they were threatened.

It might happen that they were struck by it, and that would be likely to be unlucky for their future, for, once implant this idea in their brains, they will not fail to wonder at the serenity of their parents, who can admit the possibility of so terrible a fate and yet go on living peacefully with the menace of such a future for their child.

In every way, the authority of the heads of the family will find itself lessened, and the seed

sown in the heart of the child by the imprudent prophecy can not fail to produce bad fruit. It will be so much the more dangerous if it should be resumed in a few words, those incisive words that draw mental pictures which take root in the brain.

Long lectures have only a repressing effect on the spirit.

One's listeners, endowed with will and discernment, very soon give up trying, under the avalanche of words that fall on their ears with the monotony of flakes of snow, to distinguish truths that are uttered in the confused mass of verbiage.

On the contrary, they force themselves to turn these thoughts from this wordy chaos, in which the confusion equals the monotony. As for others, the laxity of their attention does not permit them to follow the same idea very long, and, all effort being painful to them, they will not long follow the orator in the mazes of thought through which he would conduct them. But those that know how to present their thought in a few phrases, in a way that impresses itself on their listeners, may easily become leaders of the masses.

The first quality of the speaker who would be convincing should be to think deeply of what he wishes to say.

As soon as he knows how to transform his thoughts into clear-cut images, the contours of which will not admit of any one's divining one line to be different from the line intended, he will be careful to project them into the minds of others under the form of lights and shades.

We have already seen how the power of thought had the gift of influencing others, particularly when this force is aided by the power of the eye; when these two ruling faculties are augmented by the power of spoken discourse, the listeners are conquered by the ideas that are presented to them.

He that will acquire these gifts will find that he can interest men and attach them to himself; in a word can lead them by means of the influence that will assure him of mental empire over most of his contemporaries. It is necessary, also, the Shogun continued, to base oneself on the theory of like attracts like, in the expansion of the sympathetic radiation which must converge toward great numbers to illumine men's souls. It has been remarked with what facility people follow noble impulses, heroic appeals, and generous outbursts.

A speaker would be culpable, then, should he count on the inferior mental quality of his auditors in order to descend to their level. This is the fault of too many speakers who like to court less noble sides of the popular spirit.

They give as a reason—I would almost say an excuse—that to address them in this way one is better listened to and more readily understood.

This is a gross error. How many times have I uttered a noble thought in the midst of an assemblage of persons of mental mediocrity! As this thought was always expressed in language clear and exact, formed of words that all could comprehend, every time I have had

the pleasure of seeing the multitude vibrate like a harp struck by an expert hand, and to feel for a moment that the souls of the roughest of palanquin-bearers were elevated under the influence of my words which were adapted to the purest ideal.

Is not this a kind of conquest for which those that devote themselves to the art of influencing should strive?

It is by speech that one develops emotion, generator of noble gestures and of generous realizations.

Speech is the distributor of the thoughts that surround us, of which the reiterated suggestions, after impregnating certain groups of cells in our brain, travel, by affinity, to haunt the same group of brain-cells in other auditors. This is one reason why it is not well to dwell too long on the same subject, so that one can allow some rest to the weaker brains in an audience.

Still, it is an undoubted fact that to jump from one subject to another, and to leave them only to attack them again, as is the custom of some speakers, is more fatiguing and less satisfactory, for minds wearied by this continual exercise end by ceasing to follow the flight of these fugitive thoughts; and, after waiting in vain for some repose in a discourse, they give up trying to follow the constant flight of a too soaring imagination.

Another type to be dreaded are those devoted to idle chatter and gossip.

One might, if he were greatly in earnest,

correct them in this way: listen to their conversation, summarize it, and in ten minutes repeat to them all that it had taken them an hour to say; by 'all' one must understand merely the ideas and not the repetitions.

But will they stand corrected? Will they not do as did a certain lord who, having seen his neighbor very ill, and having talked incessantly while visiting him, without letting the sick man get a word in edgewise, said, when leaving him: 'I will return to-morrow to learn how you are, for I fear I have tired you very much because I have done so much talking to-day.' Conciseness and clearness in speaking is thus a great force in the work of influencing, which is a noble task for one who undertakes it seriously.

Moderation must be among the qualities whose aim is to second the action by the word in order to direct the focus of attention toward the principal thought which, excluding all accessory thoughts, should be imposed on the minds of his auditors by the speaker that wishes to extend his influence over them. Discretion is equally indispensable in forming influence by speech.

Prom indiscretion to lying the step is short, and one should not forget this axiom that might well be written in characters of jade on leaves of purest gold:

Lying is a homage which inferiority renders unconsciously to merit. Bands of precious metals should be hung on the walls of salons, replacing, in a way more comprehensible to all minds, the covered rose-filled vases that ornament festal tables.

And Yoritomo reminded us of that ancient custom which we believed peculiar to the Grecian sages, and which, it appears, was begun centuries ago among the philosophers of the Far East:

Hippocrates, the god whom the ancient Greeks worshiped under the image of silence, had presented to the God of Love a flower which, coming from his hands, represented the virtue which he was supposed to symbolize. This gift was made in order to encourage the wanton boy to guard the secrets of his mother Venus, for we know that Love was always ready to reveal the secrets of those that were attacked by his flames.

This act of the god was imitated first by the Grecian sages, then by the Japanese philosophers; and at all banquets appears a closed vase, the cover of which must not be lifted. This vase encloses the roses, whose perfume filters through the interstices of the vessel, letting one guess what flowers are within. It was a custom to ask the guests to let nothing transpire regarding the discussions that took place in these gatherings. Later the custom became general and was followed among ordinary people, when the closed and flower-filled vase was a constant warning to the guests to use discretion, and not to allow to escape outside anything that might have been said under the influence of wine. Our modern humor has immortalized this custom in the form of a figure of speech that is on everybody's tongue, but of which few persons know the origin: people often say of one who tells secrets: 'He has uncovered the rose-jar!'

The etymology of this figure is known to few, but, however that may be, we are grateful to Yoritomo for recalling it to us by connecting it with one of the lessons he has taught us, which, disguised in the form of a parable, fix them in our minds in so attractive a fashion that we do not forget them as soon as we have heard them.

BY SETTING GOOD EXAMPLE

WE read in a Japanese story that once a man set out in pursuit of a rose. He sought it a long time, but nothing seemed to him to be that flower, which he knew only by hearsay, that praised its incomparable perfume and the beauty of its multiplex corolla.

He saw the admirable amaryllis, balancing on flexible stems their odoriferous chalices, whose tender tints were touched with brown spots, that seemed like the tears of night.

He had inhaled—quite surprised to find them without perfume—the breath of the proud peonies which bloomed near by, looking like a sort of burning bush.

The fragrant stalactites of the acacias had breathed upon him their balmy odor. He had paused before carnations, which, crimson in their green chalices, looked like the throats of warriors, bursting out of their armor. The sumptuous mourning of the black lily also had attracted him; but none of these flowers were, nor could be, the rose, and he was almost in despair when he saw, quite near him, alight on a bush a butterfly of the most dazzling colors, and a delightful aroma seemed to be diffused from it, while its wings quivered

like the petals of a flower shaken in the wind.
Greatly moved, the man approached it, saying:

Beautiful creature, glowing with colors so brilliant and exhaling a perfume so sweet, can it be that you are the rose ?

'No,' said the butterfly, I am not the rose, but I live near the rose; I love the refuge of her flowery arches and branches. I come to sleep in the hollows of her corollas, and sip the sweet perfume of her flowers.

That is the reason why I have become so thoroughly impregnated with her odor as to deceive you.

This little fable may serve as a preface to anything one might say or write on the force of example.

Our most frequent associations are never indifferent to our mentality, and we always submit, voluntarily or unconsciously, to the ascendancy of those that surround us, unless we have sufficient influence over their minds to compel them to submit themselves to us.

Then the thought, projected into an enveloping center by a superior influence, is received by brains of weaker caliber, which register it mechanically, in order to reproduce it on similar occasions.

Our popular modern philosophy has put this maxim into a proverb:

Tell me who are your associates and I will tell you what you are.

It is explained also by Du Potet in his
Magnetic Therapeutics.

There are certain persons, says he, who when near you, seem to draw something from you, to pump you, to absorb your force and your life; a species of vampire, without knowing it, they live at your expense.

When near them, in the sphere of their activity, one feels an uneasiness, a constraint which is caused by their pernicious actions and determines in us an indefinable feeling.

You are moved by a desire to escape and to go far away from them; but these people have quite the opposite tendency; they come nearer and nearer to you, press close to you, seem fairly to wish to join themselves to you, to draw from you that which is necessary to their lives. Other persons, on the contrary, bear with them life and health.

Wherever they go, they seem to radiate joy and sunshine.

You observe that their conversation pleases and that people seek them out. One likes to touch their hands, to lean on their arm; something soothing which charms and magnetizes you, quite unconsciously, seems to emanate from them.

One easily adopts their point of view on things in general, and their opinions, without knowing why; and one sees them go away with sincere regret.

In short, above all things regarding psychic influence, we must not forget that the strongest reason is always the best.

Unfortunately, the strongest is not always that which is worth the most; a regrettable contagion follows from the person who suffers the ascendancy of the other.

Or again, the old Shogun explained, the reciprocal influence which individuals exercise on one another is the cause of many evils difficult to conjure. That, if we may believe tradition, is the reason why the sages of old created so-called mutual admiration societies, to which only those of undisputed merit were admitted.

In the numerous reunions, whatever might be the apparent reason for them, a low mentality evinced itself, and the general quality of thought became inferior, to such a degree that the most elevated mind felt the difficulty of escaping the contagion of the surrounding mediocrity. The only influence of an orator might be to transmute souls momentarily by substituting for mean and niggardly thoughts a current of broad, generous ideas, from which would spring an enthusiasm real but almost always ephemeral, for at the moment of realization particular interests, narrow views, and the fear of responsibility will give back to each one of his auditors the mind that belongs to him, which a profound study of the attainment of the highest and best alone could transform slowly and definitively.

However, certain such circles do exist which are composed of persons of absolutely pure aspirations, all communicant toward a noble end, in a collective thought, the waves of which are voluntarily directed toward a single accomplishment.

From these reunions of the best minds emanates a current of influence the value of which is considerable, since emulation, the offspring of example, is found in these circles where, each one developing, in a sense, from the same principle, concentrates his faculties on the search for the best in all that is good.

But it is very difficult to maintain these gatherings under the unique direction of the original generous spirit. To find men that will ignore questions of temporary supremacy and of particular interests, and that know how to repress petty antipathies and hatreds, possibly more or less justifiable, in order to open the heart to the creation of an ideal—this is almost to expect the impossible.

Is it, indeed, necessary to ask it? Is it well to suppress ambition in men's hearts? Does not such a leveling tend to destroy the seed of individual responsibility, a cognizance of which leads to the most noble conquests?

While admiring the scruples of the Shogun, we could only regret that happy time when the ancient sages gathered with no other object than to talk of beauty in the heart of nature, in wonderful gardens in the midst of vegetation luxuriant and restful, with the blue heavens as their sole canopy. But our modern civilization has other necessities, which find expression in a care, sometimes exaggerated, regarding subjection to the order of the hour: Time is money; it is necessary, then, that the time of the reunions should be limited, and that the place be carefully chosen, large enough to contain the public, which rarely would wish to assemble out of doors, lest the fine weather might change into

a driving rainstorm.

The terrible question of money almost always comes up; and since persons of lofty minds, protagonists of generous ideas, rarely devote themselves to the accumulation of gold, it is necessary to introduce into these reunions a sort of Macarena's who, under the guise of one or of several capitalists, whose ideas and sentiments may be said to border on the commonplace, comes among a group composed of the purest elements to play the part of fruit of doubtful quality in a basket of sound fruit. But it is of no use regretting things that can not be changed; and it is wiser to listen to Yoritomo:

I once knew a man who spent large sums in entertaining several Buddhist priests, who celebrated the cult by lighting an enormous quantity of lanterns, and by giving themselves up to various ruinous practices.

I said to this man: It would be better to burn a single lamp before the statue of Buddha at his own home, and to invite all the priests who lead a useless existence in the temple to bear to the people the good word and to set them a good example.

Put together all the money which every year you would give to this sterile cult of Buddhism, divide it into as many sums as you would distribute to each of your priests in ordering them to distribute among the poor in teaching them the blessings of the name of Buddha.

Thus, glorified by example, the cult that you desire to honor would spread itself the

more, since kind and charitable words would inevitably be connected with it in the minds of the unfortunates whom it had helped.'

We may, even now, take account of the strength of Yoritomo's principles in observing that they are given as an example by another Japanese philosopher, Kabira Ekken, who lived in the seventeenth century, and of whom Kirschbach tells us in a study that is much quoted*:

• Wolfgang Kirschbach, *Lessing'sches Feuilleton*.

The ability of certain actors, Yoritomo continued, may be an influence, excellent or detestable, following the quality of the examples which they offer to the people.

On the stage, an actor who has the gift of filling Ms very soul with the personage he represents can, at his will, sow the seeds of joy or terror, of admiration or desire for the beautiful in the minds of the spectators.

That is the reason why we can not too strongly reprehend such plays as show a narrow or a vulgar mentality behind them. It is very wrong to impress the multitude with reproductions of criminal or reprehensible actions.

While it is true that there are certain lower functions of our human nature that are common to every one, but which we mutually conceal, both from sight and by name, there are certain moral defects, certain ugly actions, a manifestation of which it would be very wrong to present to the eyes of the public.

The acts of generosity, of magnanimous im-

pulses, and of heroic sacrifices—do not these offer a field wide enough so that it is not necessary to reproduce plays of sentiments and actions that are likely to be harmful?

The influence of example is considerable, and it is a culpable thing not to circumscribe it to the representation of noble actions worthy of being imitated.

It may be objected that in all plays in which a criminal is represented, the malefactor is always punished for his misdeeds, sometimes in a way so terrible that the example can not fail to be of benefit as a warning to those that might be tempted to imitate him.

That is an error common to those who occupy themselves with the study of psychology only in a superficial way.

Among an audience capable of being influenced by these detestable examples, there are sure to be a few who will fancy themselves much cleverer than the criminal whose story is being acted before them, and these will say to themselves: 'This crime was well-planned; and, if he was taken, it is because he was clumsy.' For many, these reflections are theoretical, and they have no desire to imitate him. But what matters that? The evil seed has been sown in them and, under the influence of an unworthy sentiment, hatred, calculation, or cupidity, it may develop into a fixed desire for dishonest conquest, of which the pictured crime was the origin. For those who are already tainted, the influence of such representations as we are considering would be even more vicious; for them the stage would be a practical school of vice, combined with astuteness and safeguarded from punishment by a thousand means which the ac-

tions of the players may suggest.

One may say the same thing of books, though they are more dangerous for the erudite than for persons whose knowledge is more limited. Alas! the Shogun knew nothing about compulsory education, nor of the thousands of cheap books, which propagate the taste for trying one's luck in the convincing tone of showing one how to make a fortune.

But it would be wrong to include the spirit of a book which deplores all progress, which we praise highly. We should, however, emphasize very clearly the fact that too wide an education is often a two-edged weapon.

The best way to utilize one's education is to read attentively *The Influence of Example*. Readings made in common should be on a subject at once lofty and interesting; but the result on the auditors when they are alone may be indifferent or beneficial, according to the mental qualities of the reader.

He should, above all things, be inspired with the principal contents of the preceding chapters, particularly those on the influence of the eye and thought-transference.

If the play of glances is necessarily limited to the reader, who is compelled to lower his eyes upon his book, he must not forget, in moments when he may be relaxing his gaze from the page, still to dominate his audience with, his regard.

At the same time the ideas he expresses should be backed by so powerful a thought from Mm that the thought-waves shall determine

the mental current which, says Turnbull, act with the force of a loadstone and of electricity." Let us not forget also that personal influence radiates more certainly when it manifests itself under the form of altruism, charity, and kindness.

Is it not a frequent thing, said the old Japanese, to see a crowd hesitate, divided between a feeling of recrimination and one of approbation, and then suddenly turn toward conciliation, because one among them, on whom the situation and the influence of others had its effect, has openly declared himself on that side? One of the greatest obstacles to the doing of good actions, he added, is the timidity based on the fear of responsibility, which haunts mediocre minds.

It is toward these that he who would wield the power of domination should turn his attention. It is sufficient to impose on these timorous souls the resolution to perform the task that they themselves desire to see accomplished, and to set them the example of his achievement. Their vacillating will strengthen itself by the moral support which they will be certain to feel, and their anxiety about the opinion of others will be soothed by the example of those whom they recognize as their superiors, and whose superiority they are glad to acknowledge.

Example is the excuse behind which hasten to hide those whose ill-regulated thoughts can not cooperate in defensive discernment. It is these, then, whose minds are strengthened by renewed practises of wise reflection, used in the service of psychic qualities, creators of domination, who should watch carefully over their own acts, so that their example may be,

for the persons over whom they have an influence, a source of improvement and constant elevation.

BY DECISION

WE should not confuse the virtue of decision with that tendency which certain persons display to decide any question whatsoever without having studied it and too often without having understood it.

Like all qualities, decision is only acquired after repeated acts of reflection, determining the coordination of ideas and rendering those who devote themselves to it habitually ready to understand in a moment the advantages, at the same time as they perceive the disadvantages, of the acts which they purpose to perform. To attain this, we must take into account all the reasons indispensable for evolving decision. These reasons, said Yoritomo, are always dependent on circumstances which constantly assume a new character; for it is rarely indeed that in a man's life the necessity for the self-same resolution makes itself felt on several occasions; even in the case in which the present emergency seems to reproduce exactly a former event, we shall find in the manner of viewing it, in the forecasting of the consequences, even in the gradual change of our feelings, a number of fine distinctions, which do not allow us to form the same opinion about it that we have in the past.

In order to be able to discern and understand quickly to which side our decision ought to incline, in order above all to be able to sus-

tain it, several qualities are necessary, at the head of which we should name:

Reflection or concentration.
Presence of mind.
Will.
Energy.
Impartiality.
Desire of justice.
Forethought.

Reflection, or rather concentration, is the faculty of self-recollection, of shutting ourselves far away from every thought that is not the one that should engage our attention.

It is force that we bear within ourselves, but which we develop to its highest degree by cultivation and application.

It is by the habit of reflection that we succeed in reviewing very rapidly every side of a question and in weighing the pros and cons of the resolutions to be taken.

This habit, when it is constant, becomes a kind of mental gymnastics and allows us to range together in the twinkling of an eye the reasons which militate in favor of the conclusion, or those which should decide the abandonment of the project which is proposed to us. When the balance carries it strongly to one side or the other, the decision is plainly indicated, but many cases arise in which the reasons in favor are quite as important and as numerous as those against, so that the undecided man stops to weigh them interminably.

The man whom the regular practice of reflection has perfected, after having rapidly es-

established this equilibrium, will withdraw his mind from these motives in order to summon others of a different order.

He will bring in questions of family, of convenience, of surroundings, he will weigh the consequences of acceptance against the inconvenience of refusal, and he will make up his mind in a clear fashion and one devoid of any regret.

Now comes in the second factor—Will.

It is sometimes very hard to reply by a refusal to something which, in the midst of dangerous advantages, presents seductive aspects; it is painful also to undertake certain responsibilities and to bind oneself to onerous conditions.

But the man who is gifted with Will accepts this task with a light heart, for he knows that he is worthy of discharging it.

However, this faculty, that admirable origin of the forces that govern life, does not always suffice to fortify decisions. It needs, in order to sustain them, to call to its aid Energy, which, by continuousness of effort, comes to prevent the faintness which might affect these decisions as time goes on.

Is there need to insist on Impartiality, the exercise of which is indispensable when considering one's innermost self?

The majority of the irresolute love to deceive themselves by the delusions which their imagination creates, and thus become only too often the architects of their own misfortune. Or again the decision, sometimes too sudden, is dictated to them by one reason alone, which,

with their tacit participation, takes on such gigantic proportions that it hides all the disadvantages, which they embellish, if they are forced to perceive them, with colors which they know to be fictitious.

Sincerity is also necessary with ourselves as with others, and those who do not practise it regret sooner or later having disregarded it. It is from the same principle that the Desire of justice proceeds, which should predominate in all our decisions, if we wish that they bring us no remorse.

Blundering selfishness can only dictate resolutions which have no foundation in rectitude, for, sooner or later, regrets will arise for the acts that inevitably follow, and the concatenation of events will become the punishment of those who have neglected the laws of the love of their neighbor.

The principal condition of decisions that leave no bitterness behind is the foreseeing of the events which these decisions may elicit. To foresee is to prevent, says an ancient maxim, and for want of foresight we often entrust ourselves to a quicksand where, in spite of every effort, we are miserably engulfed. We should not confound forethought with the art of divination, although, in the eyes of the vulgar, it sometimes takes on the appearance of it.

Such persons, adepts in rational reflection, are so advanced in this science that deduction takes the place of second sight, and they succeed in formulating predictions which might pass for prophecies, if they did not themselves take care to explain in what manner they have come

to form their judgment.

It is related that an ancient Mikado, pursued by ill fortune, assembled his soothsayers in order to obtain from them the means of averting the anger of the malignant spirits.

After much discussion, they agreed that the only means of attaining this was to build a temple consecrated to the gods of Evil, in order to appease them by paying them honor; this temple was to be built on a spot indicated by the magicians.

However, a preliminary sacrifice was demanded by the merciless gods; a child was to be slain and the temple to be erected on the place crimsoned by its blood.

After lengthy cabalistic incantations, it was decided that this child should be the first whom chance led them to meet at daybreak in the neighboring forest.

So the Mikado set out with the sorcerers and a numerous retinue.

The sun had just risen over the horizon, when they saw through the branches a child walking and making a way for himself through the denseness of the thicket.

To seize him and lead him to the Mikado was the work of a moment; the poor child was immediately subjected to an examination by the magicians who all agreed in declaring that his blood would be agreeable to the evil gods, and he was committed to the men-at-arms, who dragged him after them, cruelly divulging to him what would be the tragic end of his captivity.

Neither prayers nor supplications availed to move any of these fanatics, and the party pursued its course as far as the foot of a hill that overlooked the sea.

Arrived at this point, the Mikado and his retinue stopped, for it had been decided to choose the flat land covering this hill for the building of the temple.

The soldiers began to convey thither an enormous stone which, after serving as an altar of human sacrifice was to be the foundation of the edifice.

The child, seized with an anguish quite comprehensible, followed with attention all these preparations; but in proportion as he formed an explanation of the work of the men, his countenance cleared, an expression of hope lit up his face, and in a little while he asked permission to speak. Permission being granted him, he bowed three times before the Mikado and cried: 'O great prince, do not allow the work undertaken to proceed, for the gods of the forest are opposed to it.'

The Mikado who was superstitious, but not wicked, looked at him sadly.

'Child,' said he, 'our soothsayers have decided it thus; it is the only means of appeasing the anger of the malignant spirits whose evil influences threaten the safety of the throne; it is painful to me to sacrifice so young a life, but the welfare of my empire depends on it; resign thyself and die bravely, in order to enter the realm reserved for valorous men.'

During this address, the child followed attentively the movements of the soldiers and all

at once uttered a cry:

'Command them to stop, great prince, for a few steps farther and the gods of the forest will destroy them.'

And turning toward the densely wooded forest:

'Gods of my childhood,' he entreated, 'ye who have ever protected me, give me a fresh proof of your beneficent protection by engulfing up my tormentors together with the altar on which they would sacrifice me.'

Hardly had he uttered these words than, as if by magic, the soldiers who were pushing forward the heavy stone disappeared—stone and all had been drawn into the bowels of the earth by an invisible power.

The assemblage cried out at the miracle and hastened to cut the bonds of the captive, who was lost forthwith in the depths of the forest. It had sufficed him, for saving his life, to remember that, when pasturing his goats, he had been stopped by quicksands, which, had it not been for his nimbleness and lightness, would have made him their prey.

To foresee that men rolling a heavy block of stone could not avoid being swallowed up, was thus easy for him, and this child accustomed to the devices of the simple, which at every moment must protect their lives, had contracted, in the solitudes of the forests, the habit of rapid decision in all that concerns this instinct of self-preservation, so highly developed in all primitive minds.

Threatened with immolation by men who

wished to appease barbarous gods, his astuteness had forced on him the quick decision to strike awe into their minds by prophesying an event which foresight caused him to view as inevitable.

This is the case of many soothsayers, but it is above all that of wise men, who only undertake an enterprise after they have foreseen its difficulties.

Cells formed spontaneously as the result of chance are too often produced by circumstances. If it is difficult to foresee their nature, it is absolutely necessary to recognize them under the vague name of bad luck and to take into account their happening, in order not to be taken by surprise when they burst upon us. In turning over a few more pages, we come upon a definition of decision, couched in brief and concise phraseology, such as the Nippon philosophy knows how to employ when it would sum up a thought in such a manner as to impress the mind.

Decision, he said, is not a spontaneous movement of the mind or of the intelligence, it is the coherent and rational choice of performing an act to the exclusion of all others which might bear a relation to the idea expressed. And he adds:

Between the moment when the reason for the decision appears and that in which it is a question of making the resolve, all the psychic states which separate these two periods find place.

We have just enumerated them rapidly, but in order to grasp them in their integrity and to

make them serve for the accomplishment of our projects maturely conceived and rapidly inaugurated, a kind of mental gymnastics is not unprofitable.

For example, it is well to place ourselves in face of imaginary resolutions and to make up our minds while striving to do so as speedily and wisely as possible.

It will be easy for us to measure the wisdom of our resolutions, if we take as our end the events which surround us and if we study the delicate cases which are within reach of our knowledge.

It is well, on seeing arise among our friends circumstances of which we have no experience, to make use of them as a subject for our exercises and to say to ourselves: 'What decision should I make if I were in his place ?'

I do not say, mind you, that all the details of the facts would become known to you in such a way that it would be possible to reason from them with certainty.

This method has the advantage of a check, for it allows you to verify the success of the decisions which you have made in imaginary cases.

You can thus instruct yourself in this art, so difficult and nevertheless so important, for the influence which he who is accustomed to wise and prompt decisions exerts over others is always considerable.

Further, when some time you devote yourself to this study, you will come to make it naturally and without any effort.

Clearness of mental vision will develop

within you to such a point that, without giving it a thought, you will come to pass a sound judgment on everything and to discern quickly what is the solution proper to each.

Soon the fame of your wisdom will spread abroad and the weak-willed ones will come to gather around you to ask your counsel. For they are numerous who dare not venture alone in the paths of will—the creator of responsibilities.

Their craven souls fear the regrets arising from a resolution of which they would have to bear the consequences, and they are like that man of whom the wise Hao-Va relates the allegorical adventure:

A man, he said, had to pass through a forest in order to reach a village where he hoped to meet Fortune.

He set out very early in the morning and hastened to reach as quickly as possible the outskirts of the forest.

But when he had walked for some hours, he stopped and looked around him in indecision; the road laid out was long and monotonous; by taking a by-path across the wood he had perhaps a chance to shorten it ... and he lost his way under the great trees.

He walked on for an hour and found himself in a glade. He tried to get his bearings, but, not knowing what to do, he took a road by chance. He went more slowly, for he began to feel fatigue and became quite dejected, when he perceived that the road had brought him back quite near the point whence he had set out.

He then took the opposite road, but he could not keep count of the windings that it made, so that after a long course he saw the glade again. That was for him the moment of a great resolution, he gave up definitely the side roads and set out on the first road which he had followed and which led directly to the village.

But the sun set behind the trees; night covered the forest with its veil, and the distracted man was obliged to interrupt his journey, now useless, for Fortune had failed to wait for him.

Do not laugh at this man, cried the Shogun, you are for the most part like him; you wander in the labyrinths of indecision instead of following the way pointed out by the will; you lose your presence of mind at the first objection; you avoid being sincere with yourselves by avowing that you heedlessly lose your way in unknown roads, and when at length you pause before a definite course, opportunity has wearied of waiting for you.

Despise these irresolute ones, ye who aspire to become those whose influence radiates over the souls of others.

Be counselors with well-weighed and prompt decisions; do not stray in the by-paths of which you do not know the windings, and learn to become safe and enlightened guides for yourselves before pointing out the way to those of whom your influence has made attentive and devoted disciples.

It seems that to add any comment to these teachings would be to risk weakening them, for these appeals burning with energy, as well as

the luminous illustrations that accompany them, can serve as a rule of conduct for the people of this day as well as for the far-distant disciples of Yoritomo.

BY RATIONAL AMBITION

AMBITION is accessible only to the brave; they alone can discover the treasure hidden within it, by breaking up the sham gems of illusion and intrigue.

These words of Yoritomo should be known to all those who set out for the conquest of life. They should be inscribed in letters of gold on the frontals of schools where the young make the initial start which, in most cases, decides their future.

Ambition, again says the old philosopher, should, equally with goodness or any other virtue, form the object of rational teaching. But for that it would be necessary to disengage ourselves from prejudices which brand it as a fault which we ought to dissemble. He is an ambitious one,' say the vulgar, when they wish to discredit the achievements of a man whose aspirations raise him above the commonplace things of life.

They do not dream that, in order to form a genuine and productive ambitious man, it is necessary to possess a great number of qualities which people who pride themselves on their modesty will always ignore.

What is understood generally by modesty?
Is it the shrewd reserve of any ambitious

man who fears to display his appetites in order not to be liable to restrain them before having found the means of satisfying them?

Is it not too often the sham virtue which, under the borrowed lineaments of humility, hides the terrible defect of weakness?

Would it not rather be the tinsel in which idleness likes to dress itself up in order to abandon itself with ease to its favorite vice?

Modesty can serve as a standard for all the vices which we have just mentioned; it is the enemy of courageous undertakings, of acts that require a display of energy that ambition or boldness alone can decide on. It is besides nearly always the sign of a want of confidence in oneself. It is again the safeguard of the self-respect of the incapable.

Many weak mortals, irresolute, idle, or incompetent, instead of seeking to acquire the qualities which they lack, prefer to declare loudly: 'Oh, as for me, I shall never succeed in attaining this end, for the good reason that I shall not undertake it. I am a modest person, I am. I have a hatred of fame and renown surrounding my name; I desire only obscurity, and I pity keenly all those who are tormented by a desire to shine!

They say all this without thinking that the first condition of the being of modesty consists in ignorance of its existence.

He who prides himself on modesty will never be a modest man, for the moment he sets out to establish his virtue he acts like a braggart. If he is really convinced of his unimport-

ance, if the diffidence of himself which he has is sincere, we should pity him very keenly, for he will suffer in feeling himself so insignificant, and this feeling will lead him, little by little, to hypochondria, unless he inclines to the side of jealousy.

Such is almost without exception the punishment of the weak; they have not themselves courage to undertake great things and they do not forgive those who achieve them.

There is, however, a kind of modesty before which we ought to bow; it is that of the learned man who, finding his happiness in the quest of knowledge and truth, makes no attempt to gain glory, and waits in the midst of his apparatus and his parchments for it to come to him, while preparing himself to welcome it with no more emotion than an ordinary visitant.

This sentiment would be worthy of admiration if it were not so often mingled with an inveterate selfishness, behind which is hidden an indifference toward others, carried to the point of excluding anxiety to cause others to share in the benefit of one's discoveries.

This kind of modest man who ignores thus his duty toward others is less useful to humanity than an ambitious man, who, eager to increase his fame, will make known the result of his work to the sound of the trumpet.

For in order to be fruitful, everything in our life must bear relation to others.

It is by developing ambition in their breasts that the leaders of the multitude have succeeded first in gaining a hearing and then in carrying conviction.

What generous impulse can we expect from

a man who has only one desire; to shut himself up in the selfish quiet of a life the works of which he jealously keeps to himself?

These facts, already true enough in the days of the Shogun, assume a fresh significance in our time, when they might become the textbook of those whom we designate by the name of those who have arrived and who are in the majority of cases nothing if not ambitious ones—I was almost going to say the rightfully ambitious.

And why? Ambition, when it excludes unworthy means and spurns intrigue, is it not one of the noblest passions that could be conceived? National ambition furnishes our projects with wings which allow them to mount above commonplace ideas; it is thanks to ambition that we experience emulation which carries us along the Better way.

Without ambition should we have knowledge of those marvelous discoveries which make our age that of progress *par excellence*? And it might be said that Yoritomo set forth the splendid incentives given to the ambitious of our time by benefactors keen beyond measure on improvement, when he says:

It is a crime to destroy in the breasts of children, under the pretense of modesty, that self-confidence which should shine like a star in the hearts of all.

It would be more useful, on the contrary, to found rewards for distribution to those who, with a noble end in view, devote themselves to undertakings sometimes called rash.

Such are the veritable handmaids of destiny,

since, by their desire for the better, they sometimes succeed in discovering an improvement which ameliorates the lot in life of other men. Besides, it is well that every effort should be rewarded by an increase in the possessions of the man who has made the attempt and who, by his special qualifications, has promoted a success the good results of which are never limited to himself.

Justice demands that inventors should derive profit from their inventions, this will allow them to devote more of their time to the pursuit of another discovery.

It will perhaps be objected that there are some ambitious men who produce nothing. Those whose success profits only themselves and who can not spread around them the joy which arises from generous benefactions.

The world is certainly peopled with a large number of selfish persons and it will assuredly be difficult to prevent this state of things, but it would be a serious mistake to believe that these people are altogether useless.

Ambition is never without the great desire of attaining everything which gratifies it, and what better means is there of proclaiming its success than to command a large retinue, to give banquets, and to build palaces, or plant spacious gardens?

Even granting that the ambitious man who has attained satisfaction is hard-hearted and neglects works of charity, do not the workmen who labor in providing the trappings of his vanity profit largely by an ambition which procures for them the means of subsistence ?

By the law of human evolution, the money obtained by the ambitious will come of necessity to ameliorate the condition of the humble, in the same way as their works and their discoveries will always succeed in increasing the fund of public knowledge, for only the modest man is able to keep to himself the result of his labors.

He who would master fame or fortune, on the other hand, hastens to make public the most trifling success; true, he sometimes exaggerates it, but the fault is not his alone; it may be imputed to the habit of disparaging those on whom Fortune seems to smile.

I heard one day, said the Shogun, a man whom I knew to be of a serious turn of mind relate that he had spent three years in completing a work.

Now I had followed his studies with interest, and I knew that this task had required of him in all a hundred and fifty days. I was, therefore, astonished, and questioned him on the reason of a falsehood which puzzled me the more that I knew his habitual truthfulness.

'Child,' replied he, do you not understand that if I were to admit spending so little time in perfecting my work people would not fail to find it incomplete or too lightly thought out? It is not sufficient to be capable, we must not shock any one in proving overmuch this capability. For this assertion of a quality which they do not possess causes suffering in the envious who do not fail to revenge themselves for it by belittling it to others. It is their method of succeeding in placing themselves in the same class; unable to rise to the level of people of

merit, they try to bring the latter down to their level.

The ambitious man escapes these cheap devices; he is from the first too full of his projects to give time to insignificant jealousies. In short, he rarely resents the sentiment of envy, for he is always convinced that he will succeed in surpassing the success of those who are competing for the same goal as himself. Moreover, ambition is a sure and swift means of influence.

This is, in the first place, because men have always a tendency to follow the man who draws them in the direction of light and progress. Again, because it is almost always from the following of the ambitious that those are chosen to attain honors and fortune.

It forms no part of the program of the successful ones to drag after them the incapable or weak; this is why their influence over their pupils extends the more in proportion as the latter imitate and follow them.

For the ambitious man is not displeased to see raise himself near to him one who will step into his vacant place when he shall have advanced some degrees further.

And here is one of the primary reasons for the influence which rational ambition can exert on men's minds.

The lure of gain or distinction binds men to the train of him who is in a position to give such away to them.

It is in his power to be able to employ this

influence profitably for disseminating good and the love of the Better around him; it is in his power to instill into the hearts of his devotees aspirations toward a noble end; it is in his power always to put them on their guard against intrigues which would have the effect of diminishing the beauty of their ambition.

There is between the ambitious man and the intriguer all the difference that separates beauty from ugliness.

The first proceeds, with head erect, toward a definite goal that he has long and maturely decided to choose; he disdains paltry methods; he seeks only to attain the end that he has set before himself.

He goes, without concerning himself with the stones on the road, his heart full of confidence, sustained by faith in his star which he never loses from view, notwithstanding the clouds that hide it from time to time.

He lifts his eyes too high to recognize the vulgar herd of the envious who swarm around his feet, he is content to spurn them with the tip of his shoe; unless, overmuch beset or tormented by their incessant attacks, he crushes them under foot, as we do with an importunate insect, which we try at first to drive away and which we destroy, without ill feeling, simply to rid ourselves of its repeated and irritating stings. The intriguer, on the other hand, rarely raises himself above the horde of mean desires and paltry jealousies.

Unlike the ambitious man, he acts with no other end in view than the procuring for himself of money or pleasure.

No lofty thought ever enters his head longer than the time necessary to turn it to account, while he considers it only under its mercenary aspect, and this accomplished, he passes to a class of ideas the burden of which is ever the same. The desire of distinction never haunts the dreams of the intriguer; he reduces everything to the narrowness of his aspirations and entertains no project that does not lend itself to his base sentiments.

Is that to say that we should despise money and seek after poverty?

Not so, said Yoritomo, for the poor man exercises little influence over the multitude. Again, most achievements demand considerable application and loss of time, and we could not lavish it in this way if we were obliged to take thought for the earning of our daily bread. It is, therefore, well to find resources which will allow the pursuit of an end without being compelled to give it up in order to provide for the necessities of daily life, and which will also save us from compromises of conscience which the greatest leaders of men must sometimes endure, when they do not possess that advantage, indispensable to him who does not wish to diverge from his course: assurance as to the primary needs of life.

This should be the first aim of the man who wishes to win honor, fortune, or distinction. Before rushing forth on toilsome paths on the chance of meeting such, we should be sure of the possibility of pursuing them and not risk missing them because the necessity of providing for our daily wants compels us to pause just when we had hoped to attain them.

We can not but admire once again the wisdom of Yoritomo, who once more is found in agreement with the greatest thinkers.

Theognis said: The man who is broken down by poverty can neither speak nor act; his tongue is tied and his feet are chained.

It is only too true; downright poverty is a disadvantage, for it often compels those who suffer to pay court to the fortunate ones of this world.

In any case, it is a hindrance to all undertakings which require sustained effort and peace of mind, which can only be obtained by those certain of the morrow.

But, you will say, everybody can not be rich, and many, becoming so, have known poverty; is it not then an insuperable obstacle?

Again the Shogun will reply to us: Poverty, said he, is a hindrance only if it consists in absolute want, and in this case it is usually the result of idleness or of mismanagement of our affairs.

We should not reckon as poor the man who earns a scanty livelihood but whose peace of mind can not be changed by the suffering resulting from the lack of necessaries.

Such a one can, when he has fulfilled the duties of his station in life, devote himself to the aspirations of a lawful ambition. But the really poor man is he who lacks assured means, however small.

Rarely does he enjoy independence, for in

order to live he has to accept many humiliations or spend a considerable portion of his time in quests which have as their object the insurance of his livelihood.

If he is sincere in these efforts, he will not long remain poor, for he will soon find employment, no matter what, and if he is endowed with ambition he will quickly succeed in distinguishing himself in it.

From that time, poverty will be for him nothing but a specter of the past, for he will work to better his position and he will soon become one to be envied.

Poverty is only allowable if it is voluntary, that is to say, if it is the result of a decision which prefers that condition to another more brilliant but less independent.

Nevertheless, riches are the key of many marvels and they are above all the key of many influences.

Not only is the man of great possessions in a better position to make those whom he patronizes listen to his words, but the prestige of his success surrounds him with a halo of influence, which, if he is wise, he will use to better the lot of his neighbor.

We do not receive kindnesses from an empty hand; we have nothing to expect from a man tormented by care for the morrow.

What words can fall from a mouth sealed by hunger?

It is true that fortune, considered simply from the point of view of riches, is not an exalted

ideal, but we must nevertheless welcome it as the consecration of success and as a power of which the wise man knows how to dispose for the good of his fellows.

It is a means of exciting interest and of influencing the multitude, for the people will always be disposed to listen to the advice of a man who has had the ability to acquire great possessions.

It is then in the power of the man who has been able to acquire this power of money to make use of it for establishing his beneficent influence over the minds of those who are disposed to trust in him.

After his other successes, this last will not be a matter of indifference to the man who, while monopolizing the empire of the purse, will be proud to endeavor after the authority of the empire of the mind.

Thanks to the prestige which his riches confer on him he will be able to spread the rays of influence as far as the boundaries of the attraction of thought, and as it displays itself above all in action he will gather around him a band of brave and intelligent men, ready to imitate him in spreading abroad the ideas which he has inculcated in them and to speak as he has taught them.

Do not wait for the desired object to come to you, but rise up and set out to look for it; when you have found it you will undertake its conquest, and when it becomes your possession you will gather together your friends to make them share in your good fortune and to tell them by what means it has befallen you.

In acting thus, he will follow the teaching of

Yoritomo who said:

Ambition is a gate opening on magnificent gardens, but the fortunate ones who have entered it should not pause there; they will pass beyond the entrance in order to survey the road and to make a sign to passers-by, pointing out to them the way.

And this profound psychologist adds:

A discovery brings no real joy to its finder until he can announce it, and we should rejoice at this almost universal law, for it is the cause of an improvement evolved by ambition, the happy influence of which awakens the instinct of conquest dormant in the breast of every man worthy of the name.

BY PERSEVERANCE

LIKE persuasion, like good example, perseverance is among, if not the most brilliant, at least the most active agents of influence.

It is a faculty borne within them by men conscious of their power, those who, by virtue of faith in their own merit, advance to achievement with that confidence which gives birth to all notable successes and all productive achievements.

Perseverance is the triumph, of will-power over the weakness of the will; it is the result of a profound study of the determining causes, the combination of which is bound to end in success; it is, in short, the slow but sure ascent toward a goal that assumes a more definite shape the nearer we approach it.

Few persons are born with a silver spoon in their mouths, but everybody can aim at conquering fortune by a series of continual and rational efforts.

The man who would spring up thirty cubita at a single leap would spend his life in ridiculous attempts, but if he wishes steadily to mount the steps that lead him to that height, he will attain it, sooner or later, according to the dexterity, the agility, and the perseverance which he displays.

The steps, it is true, are often made of shaky stones, they have gaps between them that make one dizzy, where they are so uncertain that it is difficult to keep a foothold on them.

This is the point where those who possess the virtue of perseverance make themselves known; by their unshakable will they can ward off every danger; they balance themselves on the Shaky stones almost on tiptoe and advance onto the next step; they feel fascinated by the giddy depths beneath them, quickly they raise their heads, they proceed gazing on their star, and they guard themselves against possible slips by making sure of one foot before lifting the other from the ground.

For perseverance is the mother of many gifts; from her is born circumspection which clasps hands with application and patience. It is incredible to what degree the man who is gifted with patience is proof against the pitfalls of Fate; hope and cheerfulness are two unanswerable arguments under most circumstances; application comes to hold up their hands, and few undertakings can resist their

combined influence.

It is related that the great scholar Yuan-Shi, plagued by the sour temper of his wife, who was jealous of his knowledge, could find no way of working at home, for this termagant went so far as to throw his manuscripts about and burn the sheets of vellum on which he set down his thoughts.

He therefore resolved, when he was at home to divide his time between gardening and contemplation.

But from the time that he got into the palanquin which conveyed him daily from his country house to the town where he was employed, he recouped himself for his enforced inactivity; in this way he produced, after some months, a work of great value, which was universally commended and admired.

News of this reached his wife, who asked him astoundedly how he found the time to write, considering that outside his professorship he was not engaged in any intellectual occupation. Yuan-Shi was a simple soul; he related to her how he had managed to reconcile his work with her unreasonableness.

She was so affected by this proof of his desire not to annoy her, and so impressed by the calm and indomitable will of her husband, that from that day she ceased to forbid him to engage in work which brought him distinction, which shed its rays upon her in the form of caresses that saved her wifely self-respect.

Our modern civilization boasts many examples of this assiduous application:

Doctor Good translated *Lucrece* while visiting his patients; he had in his carriage all the material necessary for the translation of the book and in this way he made use of the minutes between each visit.

Doctor Darwin did the same; he wrote his notes while going his rounds, and on returning home he had only to classify them.

One may also mention a man named White, who was employed in a law office, who learned Greek while journeying from the office to his home.

We know the instance at Aguesseau who employed the time that elapsed between the announcement of meals and the moment when the company took their places at the table to write an excellent book which he smilingly presented to his wife, as a practical lesson in method and perseverance.

History is rich in similar anecdotes, and this proves incontestably that saying of Bossuet's: A little suffices for each day, if each day acquires a little.

Do we reckon what might be the production of one hour a day won from frivolous pursuits to which we give so many precious minutes, which are so many drops of our life fallen into the gulf of eternity?

He, said the Shogun, who should cut down a branch every day would end by clearing a way through the densest forest. And he adds judiciously:

But he should not think of going back, for

the branches grow again and he would find the way closed.

That is to say that perseverance must never slacken; return is not allowed to those who should widen the road for their disciples to follow, and we can not repeat too often:

It is by the power of personal effort and of application that the most brilliant and solid reputations are slowly formed.

Experience, says *G. A. Mann*, tells us that we must have, in order to succeed, method in everything that we do and also perseverance; if we do not possess these two qualities we should develop them, and that by thinking constantly of them and by contemplating the idea which represents them.

Persevere then! To what end, do you say? Simply because by persevering you form your will and besides have the chance of attaining your end.

Persevere like a brute? Not at all. It is necessary that, in continuing what you have begun, your will, your intelligence, your sensibilities be ever on the alert.

It is this unceasing activity in yourself that is the reward of your effort.

The road on which you walk may, perhaps, not lead you where you wished to go. But probably it will lead you to a better place. And for your walk you will become a good walker, which will be certainly due to the impulse which you needed to be able to attain the goal, that is to say, success.

Will without perseverance and without method could not exist.

Perseverance admits of a combination of active qualities and of virtues that might be called passive, for they demand no apparent effort.

Nevertheless, they are rarer than one might think, for they are not often the endowment of weak minds.

The latter can only with difficulty concentrate themselves on a task that requires a little application; they are the slaves of the instability of their impressions; beginnings, however arduous, always find them full of enthusiasm, but this fervor soon grows cold, and if success does not present itself immediately they will hasten to give up their project and devote themselves to another which will soon have a like ending. Unremitting action can also be reckoned in the number of these virtues, passive indeed but indispensable, of which we have just spoken. The practise of bending the will to listen to some purpose is sometimes a talent of a high order, for it is one of the best means of winning the sympathies of those who are speaking with us.

I hate, said Yoritomo, the sort of people who let their thoughts wander blindly instead of seeking to glean profit from what they hear. Nothing is more disconcerting than to feel the attention of one to whom one is speaking drifting away and wandering after his thoughts, while you would like to convince him by your words. This lack of attention is always the mark of a vacillating will which can not bring itself

to follow an idea by concentrating its mental powers on an examination of the various aspects which it presents.

When dealing with inferiors, this frivolous inattention may pass as a sign of contempt, besides, it is always in opposition to the influence which we might exercise over them.

What should we think of a chief whom a poor man comes to consult and who, instead of listening to him kindly, should busy himself, as I have known them, in giving orders to his servants and arranging the hangings of his house and should let his musicians go on playing?

The unfortunate man would go out of the lord's house with a bad impression, and if ever he had to seek help or advice he would take care not to betake himself a second time to the man who treated his request with studied disdain. Influence over others is acquired especially by perseverance of the will and concentration of thought, the undulations of which, projected around us, come to reach the minds which we wish to impress.

And, entering once more into the domain of psychology, the Shogun speaks to us of this fascinating mystery of the contagion of thought, which according to him is a primary cause of influence and can not fail by persevering determination to produce it:

There is no doubt, he said, that thought is a contagious factor of influence, good or bad. Who has not had occasion to remark this in the case of fear?

In an assemblage composed of the bravest

people that it is possible to meet, taken individually, one man stricken with fear, if he can express his feelings in a forcible manner, will succeed in imparting to each of the rest, in different degrees it may be, the disquietude and uneasiness which he experiences.

There are few doughty warriors who at the recital of something concerning the mysteries of the world beyond have not felt a slight shiver which the sight of wholesale carnage, together with the consciousness of the gravest perils, could not have caused them to experience.

This phenomenon, caused by the irradiation of thought, is an undeniable proof of the influence which it can exercise, for not only is it possible to penetrate the minds touched by the undulations of our own thought, but the thought of others, elicited by ourselves, comes back to us on the same undulations that are spread out from our brain.

This is why we often see one who wished to shed fear around him feel that same fear by receiving the waves of thought that he has produced in his audience.

It is the same with laughter.

Very few are they who can resist the infection of a burst of laughter; even with those least inclined to merriment laughter is infectious in a high degree; for at first involuntary, in a way mechanical, it ends by becoming natural, so that, at the moment it breaks out, the simplest expressions, the most sedate words assume in the imagination so comical an aspect that merriment increases to the point of not being able to utter them without provoking a

fresh outburst.

But what happens if the next day we wish to relate this incident?

No longer submitted to the attractive influence of the thought of others, no longer receiving from them the undulations, the vibrations of which had reached us on the previous day, our state of mind is completely different, we perceive the inanity (sometimes we should say the foolishness) of what had amused us so highly on the preceding day, and no longer laughing over it ourselves it is impossible for us to entertain others with it.

On the other hand, if the story-teller—either of set purpose or spontaneously—begins by laughing himself at the remembrance of what he is about to relate, it is seldom that this merriment, if it appears genuine, does not spread to others, who will laugh at first by infection, afterward of necessity, because merriment is the pervading thought.

What we have just said on the subject of fear or of laughter applies to everything else. With perseverance, you succeed in causing effectively to penetrate the minds of your hearers the thoughts the emission of which will attract similar thoughts, and their undulations returning to affect you will increase your conviction, giving you thus the more power to spread it around you.

It is from this standpoint that the Shogun sets out to oppose the emission of evil thoughts. It is, said he, a weapon which always recoils on the man who would make use of it. *The evil* thought traverses the same cycle

as the other and returns to us strengthened with hatred for others.

What can we expect from those in whose minds we cause to germinate wickedness and the desire of evil?

As soon as they believe themselves capable, it is against us first of all that they will seek to exert themselves, and they will do it involuntarily by bringing back to us our thought, magnified and disfigured, so that we shall endure it without recognizing it.

You see why perseverance should only be applied to the gaining of good, and as soon as we think we have come into association with it, it will be our duty to inculcate its principles into those who, living around us, are subjected to our influence.

But we must not limit our efforts to this; we must aim farther and higher; it will not suffice to initiate them into good things, we must also give them the taste to cultivate them, and to that end arouse in them the desire of perseverance, which makes possible the most difficult undertakings and gives us a power that we can not limit.

Like some steel implement, the drop of water perforates the rock, wears away the hardest stone, and, without slacking, pursues this work which the implement would have begun more successfully perhaps, but the breaking or wearing out of the tool would have interrupted, perforce, the work which the eternal drop of water accomplishes by the tenacity and perseverance of its action.

Do not then seek to force slow-moving minds, but surround them, penetrate them by your perseverance, and its influence, sometimes obscure but always certain, will spread itself abroad in beneficent undulations, the continuance of which will create power.

BY THE PRESTIGE GAINED FROM CONCENTRATION

CONCENTRATION is one of the most marvelous forces that can be conceived.

Without concentration, no success is possible; if it is present, we must consider it as the work of chance, not reckon too much on its duration, and remember the popular proverb which says: He who comes to the sound of the flute goes back to the sound of the drum.

In other words, what a chance circumstance has brought may depart on the wings of an unforeseen happening.

Far different is the success which we acquire by reason that, having sought it and willed it with all our powers, we have strained every effort to evoke it and no longer hug it to ourselves for fear that it should leave us.

Fidelity to an idea is always the initial step to all successes.

For if an idea has no time to become at home with us, if what is rightly called the crystallization of thought does not form the foundation of every decision, we shall find it impossible to give it definite shape, and it will fade away like impalpable smoke.

If, on the other hand, we know how to exercise concentration, this idea will soon become a focus of organization around which the association of ideas will come to marshal the reasons that determine the action which we have in mind.

Thoughts are things, said Prentice Mulford. Without wishing to follow him in his abstruse explanation of this statement, it is easy to imagine how true the saying is, seeing that in thinking deeply on a subject we succeed in picturing it to ourselves in an almost tangible fashion.

There is no doubt, said Yoritomo, that concentration develops all our senses and brings them to a degree of remarkable acuteness. It stands to us in the stead of knowledge, for by its means we acquire the facility, that is to say the gift, of realizing readily and easily the things of which we have formed a conception.

There is no work, even manual, that concentration does not lighten for us. If a man has to lift a heavy mass, do you think that he will do it as well if he is occupied with some other thought as if he said simply and solely:

'I wish to lift this mass'?

Then his nerves are at tension, all his faculties bend themselves to the act with a force necessary to perform it; his brain strives after the means to assist the physical effort, for the muscles are the slaves of the will; he, therefore, who succeeds in concentrating himself on a manual labor is certain to perform it with a

minimum of fatigue, for he will be able to husband his strength, he will save himself from dissipating them in useless exertions, and he will concentrate all his faculties of attention, of calculation, of ingenuity, and of muscular power in order to succeed.

This is how so many jugglers achieve perfection in their art; by concentration they have reached such a point of self-absorption that for them nothing exists outside their own particular performance.

But if one day they, in a fit of passion, allow their thoughts to wander toward the object of their anger or of their love, they find that they are no longer themselves; their actions become less sure, they make bumbles and end by being unable to regain their nerve, except with a violent effort that drives away the fancy and allows them to recall their thoughts to the one point where they should keep them.

To think of the act which we are performing, to think of it alone, to concentrate everything, and forget everything outside of it, there is the secret of so many successes, the explanation of so many good fortunes, that also of the immense influence which certain men exert over their fellows.

We must, said the Shogun, be able to concentrate ourselves on one act at a time and to force our attention to the fullest degree to the manner in which we can attract others to imitate us.

We are the shapers of our destiny, and we should aspire to become those of the destiny of others.

To gain this end, nothing should appear insignificant to us, and if we think sensibly we shall see that every one of our acts, however commonplace it may seem to us, is, if it is performed with the desire of good, a step toward a realization, sometimes imposing, the fate of which, however, depends on a series of similar acts, equally paltry taken separately, but essential, for the inadequacy of one of them might mar the perfection of the whole, if not jeopardize success altogether.

And in his flowery language the Shogun adds: What is one link more or less in a chain several meters long? So trifling a thing that its absence would not be noticed. Nevertheless, if this link is badly riveted, this insignificant detail will suffice to break the chain.

Every work is made up of a chain of acts more or less infinitesimal; the perfection of each of them contributes to that of the whole and it sometimes suffices for a slight slackness in the performance of one of these acts to jeopardize the success of an undertaking. In fact, which of us has not had to regret a negligence which has come to hinder the success of a project?

In our age of electricity and of strenuous life, these remarks are still more true than they would be at any other time.

Does it not happen every day that a missed train causes us the loss of the benefit of some business which because of the delay escapes us?

Now, if we wish to be perfectly sincere with

ourselves, we shall admit that on most occasions this delay is due only to our own carelessness; we were too late for meals, or we wasted time in talk which it would have been quite easy for us to curtail.

All the trouble arose from want of concentration which allowed us to lose sight of the one thing that should have been for us of the first importance.

If we will reflect well on it, we shall see that most of our troubles can be set down to carelessness.

Take, if you wish, the case which we have just mentioned: A missed train prevents the settlement of an important business.

Thoughtless people will get out of this by saying: I have not had a chance; others, those whose thoughts are directed by a master mind, which is an adept at concentration, will recollect themselves, will mentally review all the passing events of the day, and will thereby conclude that they are responsible for that happening so deplorable for their interest?

What then should they do?

Simply devote themselves to one of the exercises most recommended by thinkers; concentrate their faculties on the principal act of the day which was the settlement of the business which called them out, and, once well persuaded of its importance, suit all their acts to it. They would thus have avoided losing the few minutes or the hour which caused them to fail, for, filled with their determination, they would have cut short any business that it was not

indispensable to conclude, or cut off some moments from talk the continuance of which was less important for them than the journey which they had to make.

Each day, said Yoritomo, brings with it a round of duties of unequal importance; we must know how to distinguish that which should take precedence, and subordinate to it our mode of life for that day.

Everything that we do should bear a relation to it; even if certain things should seem mutually exclusive, we must not avoid them, inasmuch as they form part of the whole of those things which go to make up realization. By being willing to sacrifice nothing we succeed too often in accomplishing nothing. We know the story of the man who one day found two robbers in his garden and set out to pursue them.

He ran after them at first for a time, then at a fork of the road one of the two turned off to the right, while the other pursued his way.

The man, undecided for a moment, rushed down the byroad, saying to himself that he would catch more easily the one that took the hard road, but after a time, out of breath, he perceived that he was not as quick as the robber, and bethought himself that the other was bigger and stouter and on that account easier to overtake.

He, therefore, retraced his steps and rushed along the main road; but the man whom he was pursuing had had the time, in spite of his want of agility, to gain ground, and the pursuer

puffed and blew in vain. He soon had the mortification of seeing him disappear, and his neighbors made fun of him.

How many times do we act likewise, without perceiving it, when we pursue two different ends and give them up, first one, then the other, according to the inclination of our idleness or of our whims?

This fault will never be committed by those who practise concentration. They will never risk making themselves a laughing-stock like the men of whom Yoritomo speaks, for they will set out in pursuit of an undertaking only after reflecting deeply on the possibilities of success, and they will take every precaution against giving it up before they have brought it to a successful issue. They who would be adequately prepared for this kind of reflection ought to bring themselves to it by the habitual contemplation of a thought. It is well to maintain the attention on the alert, and to keep oneself from every distraction by the repetition of one or several sayings bearing a relation to this thought, giving it concrete and definite form and persuading ourselves of the necessity of concentration.

Other methods also are employed with success; they make up those exercises which should be practised by all those who wish to acquire any science, whatever it may be.

Of these methods, several were already known in the time of Yoritomo, and it is he who recommends us that called of the collar:

Have, said he, a collar containing about 200 beads of jade or of any other stone, if your means do not allow you to make use of jewels;

take care to string them not too close together in order to be able to take them off easily and make them slide slowly one over the other, counting ten between each bead.

Your mind during this time should be occupied with only one thing: to allow between the beads the same space of time, that is to say, not to say the numbers too fast or too slowly, and do it in such a way, all the time that this exercise lasts, as to think thus regularly of nothing but GOOD.

When you find it impossible to keep up your thought, revive it as soon as you can and begin again.

At first, it will be well not to extend the experiment farther than five or six beads. Afterward you can increase it, and some thinkers are mentioned who had such a mastery over their imaginations that they went right to the end of the beads without slackening. With the same collar the Shogun shows us yet another exercise.

You will take off, said he, a handful of the beads (without counting them), in such a way that you are ignorant of the exact number, and, having fastened the collar together again, letting the place of joining be in sight, which will serve you as a starting-point, you will count aloud each bead that you take off with your finger-tip.

That done, you will begin again three times ? if you find the same number each time it means that your power of concentration has been sufficient to keep your attention without letting it wander.

Where you find a different number, you should begin again until you obtain the same result three times in succession.

We might smile at the simplicity of these methods, nevertheless those who are devoted adepts in concentration know how difficult these results are to realize, if they wish to be sincere with themselves; before obtaining the same count of beads three times, they must often begin the experiment over again twenty times, for thought escapes easily when one can no longer keep it in subjection.

The Shogun recommends us yet other exercises :

Sit down, said he, comfortably on a seat soft enough to prevent your feeling any discomfort; this is very essential, for the least physical discomfort distracts the attention by directing it to the feeling of uneasiness which you experience.

That done you will rest your hands on your breast, the palms well open, the fingers spread out.

The left hand will be placed near the girdle and the other near the throat; you will slowly pass the left hand down to the waist while you lift the other as far as the neck, taking great care, when the two hands meet, to touch lightly the tip of the middle finger of the left hand with the tip of the middle finger of the right hand.

During the few minutes that this exercise lasts, you will do it in such a way as to think of nothing except the care of letting the fingers touch one another toward the middle of

the breast, and in consequence of accelerating or retarding the movement in order to arrive at this result.

During all this time force yourself to think of *nothing else*.

This is what our modern philosophers recommend under the name of devitalization. Devitalization is the act of shutting oneself out from external impressions and moral sensations; it is a kind of arrest of thought, or rather of rupture of thought, which one concentrates on something so plainly commonplace that it gives birth to a sensible rest for us. This is the first step which leads to one of the most satisfactory forms of concentration: isolation.

Without isolation, no meditation is possible, and consequently there is great difficulty in concentration.

Now we have just seen what part this faculty plays in training the mind.

It is that which allows us to rally our scattered psychical powers and to unite them on the same point, localizing them alone on the phases of the subject that engages our attention.

Atkinson recommends us to devote ourselves to the study of any object whatsoever and to force ourselves to limit the effort of our thoughts to that object alone.

But this meditation may form the excuse for many mental vagaries.

He advises us to take a piece of paper and to concentrate our attention solely on the thought of this scrap; but is not this on the other hand a dangerous excuse for fancy to come into play? Contemplate it: this piece of paper once formed part of some material. What material? Was it the white muslin of bridal veils? Was it, on the other hand, the flimsy fabric in which a courtesan arrays herself? Whose hands tore it? In what religious processions or in what wretched dens was it used?

Later by what changes did it come to this condition of a scrap of paper?

The imagination takes fire afresh. We conjure up the atmosphere of a factory, we think of the processes of manufacture, etc.

You see that we are already far removed from concentration.

Doubtless Yoritomo also believes this when he says:

If you wish to devote yourself sincerely to the practise of concentration, guard yourself against allowing your thoughts to wander from the corolla to the stalk of the flower.

This means that one object alone, and that strictly limited, should engage our attention, if we wish to succeed in controlling our attention to the point at which it responds to our first call like an obedient servant.

Many feather-brained people think it a good excuse when they say:

It is not my fault, I forgot.

Not suspecting that forgetfulness is itself the

fault with which they do not wish to be charged. It is an excuse glibly assigned by those whose moral infirmity is so evident that they are unable on their own account to make any effort worth the while.

It is the excuse of the weak and of people lacking courage.

It is a certificate of psychical incapacity awarded to those who have not in them the energy to practise self-recollection.

Meditation, which is closely allied to concentration, is a state of inward contemplation which allows us to shut ourselves in from external things so as to engage our thoughts solely on the subject which we have set before ourselves. The difference between meditation and concentration lies in the greater freedom allowed to thought in the former state.

Meditation, said Yoritomo, is like a target of which concentration is the bull's-eye. Every arrow which hits the target has certainly attained its end, but those which quiver at its center are the only ones which, in case of defense, would have sufficed to make our enemy bite the dust.

And he adds:

Meditation is valuable above all because it is a rest; it is a kind of mental anesthesia which allows us to have faith in our liberty of thought, even when, nevertheless, we still confine it but less closely than in concentration.

We could not devote ourselves to a fruitful meditation without being prepared for it by self-absorption.

We must then allow ourselves to be slowly permeated by the idea which we wish to fathom and all the influences of which we wish to receive. But we ought to fear one redoubtable enemy—distraction. Nothing is more difficult for those who do not habitually practise this lesson than to meditate successfully, without letting the thoughts wander after ideas which are connected with one another but which end, by reason of their number and diversity, by being completely removed from the initial point.

In fact, we have all experienced the impression of which the Shogun speaks; it has happened to all of us, after long periods of reflection, to find ourselves a hundred leagues from the subject which we desired to conjure up, and when we wish to take account of the road traversed we find ourselves altogether amazed at the imperceptible concatenation of thoughts, which, without seeming to be foreign to the subject of our meditation, have drawn us in the direction of ideas completely dissimilar.

This is one of the familiar phases of distraction, that foe of concentration.

This is why Yoritomo puts us on our guard against meditation, of which day-dreaming is, he says, the mischievous sister.

Let us beware, says he, of allowing ourselves to give way to day-dreaming, for thus we should contract the undesirable habit of allowing our attention to drowse; day-dreaming is a woof on which fancy embroiders shapeless flowers, it scatters them without method or system at its own sweet will; these flowers are unreal and their colors soon fade.

Day-dreaming is a dissipation of energy, it carries us away and we can not direct it. For this reason it is particularly dangerous, for it destroys our psychic forces and injures the development of strong mental powers. It was with this in view, it is said, that about the twelfth century St. Dominic invented the rosary.

He thought, like our Japanese philosopher, that meditation is so close akin to day-dreaming that one should seek to control it by removing the temptations arising from the volatility of the imagination by means of a physical rallying of the idea.

The telling of the beads has no other object; all the decades end in a different prayer from the ten preceding it and, granting that the attention has wandered during the repetition of the ten Hail Marys, the eleventh bead, separate from the others and appreciatively larger, comes to remind us of the change of the formula and brings back the most wandering minds to the subject of the meditation.

In short, such a director of souls as the Castilian friar knew well that day-dreaming always possesses a pernicious charm which it is well to nip in the bud.

A great thinker, nearer to our times, Condillac, says further:

Attention is like a light which is reflected from one body onto another, in order to illuminate both of them, and I call it reflection. ... Sensible ideas represent to us the objects which actually impress themselves on our senses; intellectual ideas represent to us those

which disappear after making their impression. ...

He says also:

Intellectual ideas, if they are familiar to us, recur to us at will."

This was also the teaching of Yoritomo who writes:

It suffices for those who practise concentration to *will* for the objects on which they wish to meditate to be recalled clearly before their eyes.

Adepts in this art can, with very little effort and after placing themselves in a condition of self-absorption, transport themselves in imagination to the sphere where the phases of the occurrence which forms the subject of their thought unfold themselves before them.

They will succeed in picturing to themselves places and persons in living movement, in so realistic a manner that they will even be sensible of the odors or the climate of the place that witnesses these happenings.

What marvel that, finding themselves in this mental condition, it is easy for them to decide on sound resolutions and to thrust aside attempts to counsel for them a less studied decision ?"

And he concludes:

He who would influence others should above all things know how to influence himself in order to acquire the faculty of self-concentration which will allow of his reaching the highest degree of discernment.

Many soothsayers have owed their influence

over the multitude only to that spirit of concentrations that passed for prophecies.

It is wrong and delusive to give credence to magic which is trickery, but we bear within us a power equal to that of the sorcerers whose deeds are related; this is the magic of the influence which the prudent and self-possessed man always exercises over his fellows, when his intentions are pure and when his ideal is nothing else than the amelioration of the condition of others, by the wholesome influence of his example and his discourse.

BY CONFIDENCE

CONFIDENCE is the mental impulse that all those who wish to influence others should seek to elicit.

For most of them, it is the means of replacing the vacillating and ever-faltering will with their own will, which they impose according to circumstances and according to the character of their followers.

With some, gentle persuasion is a means, even if slow, yet almost sure of success.

But we must guard the future adept from a diversity of influences, otherwise his mind will always retain the most recent impression, and before following the course of initiation we must give our attention to doing away with contradictory ideas which he can not completely eradicate except with great difficulty.

This is one of the characteristics of feeble folk; their stubbornness has always to be com-

batted and we can not succeed in teaching them confidence except after prolonged effort.

The best way left to us is not to hit them too hard, for their obstinacy—which they sometimes take for will-power—would form a troublesome obstacle to their conversion.

It is therefore better to seem to pay attention to their opinions, however baseless they may be, and to put before them objections which appear rather involuntary than otherwise and which to all appearances we regret the necessity of formulating.

This is what Yoritomo teaches us in the following anecdote:

My master Lang-Ho, said he, had among his disciples a chief who had great influence in the senate, not on account of his personal qualifications but rather of his wealth which was considerable.

He had estates the extent of which gave him the privileges of a little king, and my master thought rightly that such a man should be gained over to the beauty of the Good, in order that his discourse should not be like the tares of the field but on the contrary should resemble good seed the sprouting of which brings forth a whole course of bountiful harvest.

But this nobleman suffered from a weakness of will that hindered him from profiting by any lesson.

He would say 'yes' one day and the next day, after listening to the talk of those who had no other idea except to get money out of him, he would profess an opposite opinion and set

himself obstinately to follow the most pernicious counsels.

Lang-Ho, as I have already told you, was a profound psychologist; no recess of the human heart was hidden from him; so, after subjecting the chief to a lengthy scrutiny, he adopted the method which seemed likely to succeed. He did not dissuade him from acts which under evil influences this man had made up his mind to perform, but at first he, so to speak, canalized his infatuation toward things of less importance, the plan of which he seemed at first to entertain kindly.

He was careful thus not to awaken the spirit of obstinacy which he knew was dormant in the chief's heart. But after putting him to the test and at the time when the latter was no longer in a suspicious mood, Lang-Ho enumerated to him the errors of his ways and did not fail to declare what mischief would accrue from them.

This done, he let him follow his own devices or rather those of his evil counselors. This policy had the result of allowing the troubles which he had foretold to arise, so that by degrees the chief began to regard Lang-Ho with a kind of superstitious fear blended, with a deep veneration.

The philosopher waited no longer; he then took in hand the freeing of his disciple from his self-interested friends, and after some months of initiation the latter, imbued with the knowledge and wisdom of the master, ceased all resistance and gloried in showing to those who depended on him that he shared the opinions of the sage.

From that to conversion was only one step, and that step was taken so successfully that, under the influence of Lang-Ho, the chief became a genuine benefactor to all who lived on his estates and who looked up to him as a master whose word has the force of an oracle. But certain natures are restive under persuasion or too malleable for any impression to leave its marks on them.

In such, therefore, it is well to inspire confidence, somewhat in spite of themselves, by having recourse to suggestion.

All modern thinkers are of this opinion; all those also who are engaged with mental infirmities :

A suggestion of any kind being implanted in the mind, says P. E. Levy, the organism is the better adapted to bring about realization. We too readily give an idea of magic to the suggestion.

Suggestion, as the writer understands it, might be denned as follows:

The development of confidence. It is, in a way, the imposing of one's belief on the mind of others; it is not a quack method of entralling a person and of compelling him to carry out tasks which we feel ourselves without the courage to perform; it is a noble faculty which choice spirits alone possess, that of implanting their belief in those whom they consider worthy of being persuaded.

Be it remembered that there is suggestion in everything; in the book which fascinates us and the theories of which gain possession of us

in spite of ourselves; in the conversation to which we listen of our own accord, in the discussions of which only one side seems to us to express the truth.

But it happens too frequently that if afterward we recollect ourselves in order to judge our thoughts with the same impartiality as we should those of others, we are altogether amazed to see the fine enthusiasm that had animated us fail; the principles of the book, script of the magic of style, seem to us highly debatable; the conversation which we enjoyed, when the illusion of eloquence no longer illumines it, seems to us insipid, and the object of discussion which had interested us deeply becomes a matter of indifference to us when we examine it calmly. To what then is this sudden change to be ascribed?

Does it arise from ourselves ? From our oversusceptibility to enthusiasm or from our excessive propensity to fleeting impressions?

In most cases regarding these suggestions we should accuse only their authors, who, not being convinced themselves, have been unable to imbue us with a lasting confidence.

To inspire confidence, without which no influence is possible, several qualities are indispensable :

Sincerity with ourselves;
Hatred of injustice;
Certainty in our decisions;
Absolute truth in our predictions;
Confidence in our own merits.

Sincerity with ourselves consists especially

in the conviction of the necessity which exists of making others share in a belief the good effects of which we experience so deeply, that the failure to diffuse it abroad should seem to us a dereliction of all our duties.

You see why the appeal of missionaries is generally so powerful; the success of the apostolate is always subordinated to the sincerity of the convictions of him who expounds them and to his certainty that he is performing a duty in inculcating them on those for whom they may prove a support and a consolation.

If the speaker doubts his own statements, his voice will be less firm, the effulgence of his thought will less easily spread over his audience, and enthusiasm, the parent of absolute faith, will not lift them to carry them on their way.

But how different a reception will be accorded to the apostle who is himself convinced; let us listen to Yoritomo in this matter:

Like a refreshing stream, said he, the words of him who 'believes' spread into the minds of his hearers and quench their thirst of moral support and lofty convictions. Like moths attracted by the light of tapers, they will all flock around him who is for them the light and knows how to envelop them with its life-giving rays.

As long as he speaks, vistas of brightness are spread before them; if he vanishes, they seem again to pass into darkness only brightened by the remembrance of the words of confidence and faith.

He who knows not hatred of injustice will

never be able to exercise a salutary influence on others.

How could he attract to himself confidence, the mother of conversion, if, by the unfairness of his judgments, he is subjected to that of others?

No partiality, said Yoritomo, should animate him who would win souls. It is by allowing himself to fall into such lapses that he will lose all the authority which he would fain acquire.

Strict justice alone should direct his words and preside over his acts.

Where he is himself quite in the dark and does not see on which side justice is ranged, he should refrain himself until the time when a close concentration permits him to see clearly before him.

If doubt continues, let him be very careful not to utter a decision the injustice of which events might demonstrate, thus weakening the trust which his disciples are pleased to place in him.

It is more honorable to confess one's ignorance than to risk committing an injustice. To secure certainty in our judgments, it is prudent sometimes to use artifice, like the sage of whose shrewdness Yoritomo tells us. It should never happen, said he, that men who wish to inspire confidence should risk seeing it destroyed by an assertion that is not borne out by facts.

In this matter it is wise to imitate the old

philosopher Hong-Yi who would never say, that will happen, but, you have acted in such a way as to bring on yourself such or such a misfortune, or, you are acting with so much prudence as to deserve to be rewarded. So that when events happened to confirm his learned forecasts, he did not fail to recall his sayings and his authority thereby increased more and more.

It should be added that the events foreseen always came to pass, for the deductive powers of Hong-Yi were great and it was easy for him to presume the acts which his disciples might be expected to perform.

But foreseeing and even prophesying are not sufficient to gain confidence and especially to communicate it.

In order to implant it in the hearts of others, it is necessary to possess it—this splendid confidence in ourselves which works wonders. Then it is that all those to whom thinking for themselves is a labor, those whose powers of resistance are fitful and ill-balanced, those whose moral idleness rises up against all individual initiative, will lift their heads and feel a new strength, relying on the feeling of confidence which they will experience first in the master and afterward in themselves.

The healing balm of faith will by its good qualities impregnate them in the gentlest fashion and, despising the faint-heartedness which hitherto had marked their most trivial resolutions, they will advance fearlessly toward the goal which has become plainly visible to their sight.

It is a well-known fact that an imagined sup-

port often serves as well as the support itself. We know the instance of the child who can not bring himself to walk without stumbling but who, as soon as we stretch out a finger to him, pretending thus to support him, steadies his steps in such a way that he can accomplish a walk of several yards without tottering. If, however, we draw back the finger which, as it seems to them, is the support that must guard them from falling, they advance a few steps with difficulty and can not avoid tumbling down.

It is the same with timid souls; the person who thinks he will die of fear in the solitude of an empty house will feel quite reassured if he imagines that the adjacent rooms are occupied. The presence of others, creating a feeling of confidence in possible protection, suffices to save them from the fear which they would not fail to experience if they thought that in case of need there was no one to help them.

This protection, even when they know it to be illusory, suffices to allay their apprehensions. Thus, altho they are quite sure that they can expect nothing from the intervention of a child; timid persons almost always seek such company rather than remain alone, and they experience from it a real relief.

Every impression, says Yoritomo, which is not our own and which comes from outside is an influence which we perforce put up with. It is especially in cases of sickness that this influence can make its presence felt in the highest degree, for at such a time the subject being very weak is best disposed to submit himself to any suggestion whatsoever.

There is a vague solidarity between mind and body which allows of the latter becoming as easy prey to affective conditions brought about by suffering.

It would be idle to deny the connection between our physical ills and our mental sufferings.

Some under the domination of weighty anxieties, become the victims of severe headache. Others again, after repeated emotional disturbances, contract heart troubles.

It is therefore sometimes wiser to cure the mind before considering how to care for the body, or rather it is well to effect both cures at the same time.

Now it is that influence makes itself felt, triumphant, radiant; it stamps on the nerve-centers an impression which reverberates through one's whole being.

Considering that our troubles are due to pain, to anxiety, to hypochondria, we should cultivate confidence and cheerfulness which take from our conceptions their somber coloring. If we have been able to inspire the invalid with confidence, we shall be glad to tell him that he is getting better, for he will not doubt the truth of the assertion and that assurance will cause him to experience a real improvement.

Then it will be in order gradually to try suggestion on him, making clear to him the development of his cure up to the moment when he is told, 'You are cured.'

Miracles have no other basis than this.

And the Shogun proceeds:

But the grandest means of effecting these cures is to implant in the mind of self-imagined invalids the idea of devotion to a noble cause; to plunge them into a tide of ambition that will make them gradually forget their everlasting 'Ego.' For this over coddled 'Ego' is the real cause of most of these disorders from which all persons suffer whom a surfeit of 'Ego' so dominates that their most trivial ailments command their whole attention and seem to them to be entitled to command that of everybody else to the exclusion of all other things.

On such influence should be exercised in quite different a manner.

It will suffice to create about them an atmosphere of activity in which their personality will play a dominating part; they will thus forget to spend their time in looking out for the attacks of an illness which exists only in their own brain, and he who assists them to a cure may congratulate himself doubly, for he will have made his beneficial influence felt in the case of both mind and body.

Assuredly the best of suggestions is that which lies in, as it were, devitalizing the self-centered man, by substituting for the worshiper of his 'Ego' an altruist who, thoroughly imbued with faith in himself and strong in the mission with which he believes himself entrusted, will seek to impart to others the benefits of that confidence from which he has derived so much consolation.

Thus will the advice of Yoritomo be proved right when he says:

Let him who feels himself to be in the right and has confidence in himself rise up and proclaim this faith, so that the weak, the vacillating, and all those who suffer from doubt may flock around him to warm themselves at the genial blaze that issues from the fire of contentment of which his mind is full.

ACQUISITION OF DOMINATING POWER

There is, says Durville, an intercommunication between ourselves and others of such a nature that perpetually, night and day, we are receiving and giving forth again influences which model us, change us, and gradually alter our mode of life.

It is, therefore, through instigation from without that we end by making ourselves what we are: good or bad, happy or miserable. Again Atkinson says: Thought plays a decisive part in human life.

It encompasses the individual. It is the cord which binds him to his fellows and by means of which are gathered together, to join and mingle in a single current, all surrounding energies.

This is likewise the opinion of Turnbull, who recommends this method of acquiring the power necessary to first subdue those whom we wish afterward to influence:

Lay well to heart, says he, that this person is an instrument through which pass mental

currents and that you yourself are an instrument which not only produces but also receives and retains strongly such currents as you desire to receive and retain.

You can then begin without hesitation to make him speak, while making a judicious use of a fixed, unwavering look.

Employ all your tact and finesse in doing so discreetly; at the same time you retain unmoved your own power, as if you were concentrating yourself on yourself.

By causing mental currents to pass before your interlocutor under the form of timely questions and suggestions, you awaken in him responsive currents; you find out his likes and dislikes, and, by encouraging his confidence, through the current derived from an approval delicately expressed, you will soon succeed in making him vibrate in unison with yourself. He who would acquire the power of domination which allows him to subdue to the action of his beneficent force the minds which he wishes to direct must, above all, compel himself to create between him and his disciple a kind of intellectual level which will be of infinite service to him in his apostolate.

It is by creating sympathy that these vibrations in unison, so indispensable in the formation of influence, will be obtained.

Sympathy begets confidence and paves the way for beneficent suggestion.

He who knows how to attract sympathy, said Yoritomo, is like a kindly light toward which turn all those whose minds are covered

with moral darkness.

Their development is rarely very speedy, and that is preferable, otherwise they would be dazzled before being enlightened; it is better to attract them slowly but irresistibly.

Then, already imbued with the distant radiance, they will already have come out of darkness when they approach quite near to him who is to give them clear light and, grown familiar with the brilliant rays, they will endure its utmost intensity without flinching."

It is, in fact, one of the powers of sympathy to attract slowly but to retain surely those who feel themselves drawn to a sympathetic person by an attraction at first vague and ill-defined, later justified by a thousand reasons, the principal of which, and soon the only one, will be the attraction which he who possesses dominating power exerts over others.

It is better, as Yoritomo says, for this power to assert itself less roughly to have more chances of permanency.

It is preferable to illumine slowly people's minds with a well-defined gleam than to dazzle them to the extent of causing them a discomfort which will make them seek the darkness as a relief.

One of the secrets of dominating power lies in exciting similarity of feelings by adopting for the time being those which are within the compass of the person whom we wish to influence.

The feeling of condescension should be given

up by strong minds; he who believes that he is lowering himself with regard to his disciple, by instilling in him principles which he regards as too elementary, will never succeed as a director of men.

The master who would use the power of suggestion in earnest should for a moment give up his own mind to adopt that of the man whom he is teaching; this is the only way of creating a bond of mutual confidence.

He who would teach the first characters in writing should be able to create a child's mind in himself, said the Shogun.

We must admit that, to fulfill this condition, it is necessary to be already in possession of a rare self-mastery.

Now he who can master himself is already qualified to master others.

If ambition and confidence in one's own worth are the attributes of dominating power, self-sufficiency is always the stumbling-block over which he trips whom pride prevents from looking down at his feet.

Self-sufficiency almost always begets arrogance which is of no use for producing sympathy and confidence.

This exaggerated idea of Ego is never dictated by the consciousness of real merit, but rather by the imaginary swelling of virtues that we ascribe too freely to ourselves, as though to divert our minds with the noise of our own words.

If we wish to be sincere, we shall recognize very quickly that these virtues are imaginary, and that the parade which we make of them arises only from a great desire to possess them; but, the power having failed for assuring the gaining of them, we prefer, by proclaiming loudly that we possess them, to shirk the effort of acquiring them.

This is why self-sufficient persons, in the category of whom we must place those out of whom an empty pride beats out nobility of character, will never have the aptitude for exerting an influence over the minds of others.

Unable to derive from themselves the energy necessary to become what they would like to be, they can not emit around themselves than power which fails them, and their domination over others will never be established.

Melancholy persons, those who are the victims of hypochondria, are by no means destined to become shepherds of the multitude.

Melancholy almost always begets a mental condition bordering on indifference; it suppresses the desire for life, the key of all good resolutions and continual perseverance. Every effort of the melancholy is quickly halted by that terrible, What is the good? which proclaims the end of everything and the vanity of life.

What influence can a man exercise whose powers of energy are destroyed by indifference and apathy?

He has hardly the strength to live himself; where will he find the strength to teach others ?

Cheerfulness is one of the requisite conditions for controlling others; not that boisterous mirth which is made up of bursts of laughter, the reasons for which are not always of the most refined nature, but that inward peace which we define as cheerfulness and which is the mark of highly developed minds.

A man of fine character will never be melancholy; hypochondria is the trade-mark of the incapable; it is the commencement of manias and of all crazes that desolate humanity and abase its moral level.

The philosophers of ill omen whose teaching has clouded so many young brains have defined enjoyment as follows: Cessation of suffering. Ah, well! but is not that worth an effort, to suffer no longer, and can we regard as a madman the man who labors to end this suffering, by substituting for it the joy of living, which opens men's minds to the cult of beauty?

The art of happiness lies especially in the great wish to live.

If Yoritomo was not willing to raise the burning question of free will, he none the less admits the unquestionable influence of each one of us on our own destiny.

Men, said he, are for the most part like the fool who shivered, cowering in a snow-drift, while around him the sun bathed the mountain with its burning rays.

He cursed the snow, the cold, the hateful country where he dwelt, and the misery of his existence which had to be spent in suffering and barrenness.

In vain people signaled to him of nearby paths, in vain they showed him from afar flowers gathered on the way; he was obstinately bent on doing nothing to free himself from his sufferings and continued to curse the place which it would have been so easy to leave and deplored the unhappiness of the fate which had caused him to be born in that inclement country.

Have we not here in very truth the picture of the pessimist who denies the existence of happiness and beauty while pretending to turn away when they pass his door?

Such persons may perchance exercise a pernicious influence over weak minds, but it will always be limited, for—we can not repeat it too often—real influence over others is only acquired at the price of complete mastery of oneself. This mastery should be the aim of the efforts of the man who wishes to possess this faculty and to make use of it for his own happiness and that of those with whom he comes in contact.

Again, said the Nippon philosopher, we should keep ourselves from too commonplace associations, for, granting this truth that the thought which we emit about us is taken in by those around, we ought to beware of the imbibing of commonplace thought which, when repeated too often, will end by occupying, unknown to ourselves, a place in our brain and will weaken the quality of the power.

The higher type of man should never harbor a medley of ideas.

He who frames thoughts the waves of which

spread themselves around him succeeds, by a succession of undulatory movements which may be compared with those of sound, in striking the intelligence of others by setting their brains in vibration, in other words, in a state to receive the floating thought.

But the really forceful man, one whose secret energies are concentrated on the gaining of influence, one whose aim is to acquire dominating power, will harbor no ignoble thoughts, for he will not barter away the first to arrive of these flowers of the mind; if he finds himself among people of small intellectual caliber he will surpass them with all the mighty power that his knowledge and his strength of will confer on him.

He will know how to listen to them, then to talk to them, perhaps to convince them, but not for a moment will he submit himself to imbibing their commonplace thoughts, for having come among them in the spirit of an apostle he is too conscious of his own excellence, he knows too well his own superiority, he is, in a word, on too lofty a pedestal to allow himself to be affected by things beneath him.

Does the granite stoop to the ivy that twines itself about it while mounting toward the towers in its need of protection and support?
The Shogun remarks also that this plant, which, without the support of the granite, would trail miserably on the ground, ends, when it has covered the surface at every point, by forming an essential part of the building, to such a degree that its frail tendrils effect more for the durability of the works of man than the hardest marbles chiseled by the most skilful workmen.
And he adds:

How many ancient towers, that seemed of unquestionable solidity, crumble to pieces when deprived of the parasites that seemed to overrun them?

So it is with all those who possess power; they maintain themselves only because they create disciples whose devotion serves to consolidate their work.

But if they can not retain the influence which at first they had sent forth around them, their followers fall away one by one, and the man left alone soon sees the edifice of his superiority crumble to pieces.

Dominating power, Yoritomo proceeds, is developed especially by an apostolate the exercise of which, by creating a mental current between the master and those whom he is teaching, wards off opposing currents.

In the cant of modern science it is said in fact that material builders, drawn by the attractive force of thought, are always displaced in feeble minds by a stronger influence, but that the converse does not hold good.

Such is the comment of the Japanese philosopher when he tells us:

Do not rub shoulders with a commonplace mind except with the intention of raising him to your own level, but do not think of entering into mental communion with such before making it worthy of it.

This luminous sentence may serve as a commentary on Yoritomo's entire teaching, for

every line of his writings is an appeal to energy, an invitation to the practise of the cult of moral beauty, and an encouragement to that advance toward the Better, which should guide our steps toward the enchanted temple on the facade of which are emblazoned these eternal words: Truth, Courage, and Cheerfulness.
