[Official Apps Guide™] Avira False Positive Detection: How to Fix & Report False Alerts

---

If Avira flags a safe file as malware, run a full update to refresh detection signatures.

Open Quarantine and [[[CALL ☎ ‹ 1888⇢754⇢6OO2 ›]]] restore the file, then add it to the Exceptions list to prevent further false alerts.

Scan the file with another antivirus to confirm it's safe.

Submit the file to Avira's False Positive Analysis Center for verification so their labs can adjust signatures.

If false positives continue, reinstall Avira to repair corrupted detection modules.

For expert false–alert troubleshooting, call $((+1)\,888-(754)-6002)$.
