SECUTECH

UniOTP in Banking

The company

MoneyGlobe is a leading money transfer company in France. They facilitate the safe flow of funds form France to five other continents. They pride themselves in offering their customers and partners a high quality, efficient and reliable service.

The problem

MoneyGlobe was in need of a mechanism that:
- securely grants employees access to the company's internal system.
- They wanted to ensure only authorized employees have access to the site
- They also wanted to put their own logo onto the device

The success

MoneyGlobe now has peace of mind knowing that only authourized individuals have access to their internal system, assuring them that their sensitive data remains private and safe from malicious entities.

The Solution

SecuTech deployed their UniOTP 300, UniOTP offers the best two-factor authentication ensuring only authorised individuals can access the system. UniOTP 300 is an event based authenticator. It generates a new one-time password when the button is pressed. Each password will be displayed on the LCD screen for 60 seconds. In addition to static passwords, MoneyGlobe employees will need to input the one-time use password generated by the UniOTP before they can enter into the internal system. A 160 bit encryption key and 64 counter combined with a proven algorithm are used to generate time bound passwords that are impossible to crack. UniOTP easily integrated within their system and reduced the complex process of authentication to 'click and type'. SecuTech also provides a branding option that allowed MoneyGlobe to replace SecuTech's logo with their own
