**Sub: Clarification to Cyclonic Wind Load Test Report of JA Solar PV Module**

**To whom it may concern,**

In regard JA Solar's 60-cell PV module JAM60S20/MR, it's confirmed that cyclonic wind load test has been conducted and observed by Asset Services and it's verified that the PV module is capable of withstanding a design wind load as specified in test report DRW-20-1203.

To remove any doubt, although this test was only conducted on 370W panel, it's confirmed that testing results apply to all series of JAM60S20/MR panels, covering all available power classes including 390W. This is because even the power class varies, the mechanical configuration remains identical within the same product type. The power class variation comes from cell sorting and cell efficiency improving, none of them affecting panel layout or mechanical configuration but electrical parameters.

Please note that load evaluation is project dependent engineering, and it can only be addressed on case-by-case basis, as some geometric configurations and mounting structure variation could induce wind load tolerance.

It is the responsibility of system designer and installer to conduct load calculation and to select appropriate mounting structure. System designers and installers are solely responsible to ensure PV panels are installed in accordance with JA's installation manual and comply with applicable local electrical and building codes.

Yours faithfully,

**Andrew Zhai**
