

Extending the lifespan of PU upholstery

Congratulations on the purchase of your new office chair. Please take the time to read this leaflet carefully as the information provided will help to extend the life of your product.

What causes PU to peel

Heat and humidity combined with body oils, perspiration and friction from rubbing against your skin can cause deterioration.

These factors breakdown the PU upholstery's protective coating and water resistance.

To extend the lifespan of your chair:

- Follow the recommended cleaning advice found under the seat
- Minimise contact with bare skin
- Keep your chair in a cool and dry environment
- Keep your chair away from direct sunlight

Sitting practices

Poor posture can lead to body aches and pains, as well as cause the PU to flex and stretch more than usual.

In your natural seating posture, pressure is evenly distributed across the surface of the chair.

This is better for you and increases the lifespan of your chair.
