LONG TERM VEHICLE STORAGE FOR LITHIUM BATTERIES

Given the extraordinary circumstances we find ourselves in, vehicles may need to be placed into medium to long term storage. This document has been drafted to clarify the correct procedure for long term storage.

1. Ensure that the batteries are fully charged, this could take a number of hours to achieve so it is suggested to allow the vehicle an overnight charge to ensure that the batteries are fully charged. Once this is done switch the vehicle on and observe the State of Charge reading, it should indicate a fully charged set of batteries.
2. If the vehicle is any vehicle other than an RXV ELiTE Golf Car put the run/Tow switch into the Tow position. If it is an RXV ELiTE Golf Car leave the run/Tow switch in the run position, do not put it into the Tow position as this will flatten the batteries. Remove the charger cord from the vehicle and switch the charger off at the plug. The vehicle is now ready for storage for 180 days.
3. After 180 days return to the vehicle, switch the charger back on, plug the charger cord back into the charger, charge overnight. Return to the vehicle the following day and remove the charge plug from vehicle, switch the charger off and the vehicle is good for the next 180 days.
4. When the vehicle is ready to return to service remember to put the Run/Tow switch into the run position.
