

Mounting Cushions

A clean conveyor belt is essential to protect one of your most expensive assets. The best way to ensure full belt width cleaning is to use Mounting Cushions.

The costly problem of material fines clinging to your conveyor belt.

Often materials fines cling to the conveyor belt past the unloading point. The residual material is carried back on the return side of the conveyor, eventually discharging at various points along the conveyor belt, presenting hazards to personnel and plant efficiency. A conveyor belt cleaner is an accessory used to remove material adhering to the return side of the belt. Conveyor scrapers or conveyor cleaners are the most common/efficient conveyor belt cleaning system in reducing carry back.

There are three main types of conveyor scrapers:

- Primary belt cleaners
- Secondary belt cleaners
- Return belt cleaners

A mounting cushion makes sure cleaner tips can move independently and are always accurately aligned to maintain tip to belt pressure. These cushions ensure cleaner tips work properly even on belt surfaces that are worn or imperfect.

TYPES

P Mounting

H Mounting

BENEFITS

Produced to the highest standards to provide consistent rubber compression rates and the exclusion of voids during the moulding process.

Full stainless steel construction including fasteners

Exceptional rubber to metal bond strength is achieved to ensure longevity.

Rubber compounds are formulated to prevent compression set.

Tungsten Carbide Tips

A clean conveyor belt is essential to protect one of your most expensive assets and our Tungsten Carbide Tips maximise the service life of your conveyor belt cleaners.

The costly problem of material fines clinging to your conveyor belt.

Often material fines cling to the conveyor belt past the unloading point. The residual material is carried back on the return side of the conveyor, eventually discharging at various points along the conveyor belt, presenting hazards to personnel and plant efficiency.

A conveyor belt cleaner is an accessory used to remove material adhering to the return side of the belt. Our tips remove any residual fine material on the conveyor belt after load discharge.

The best way to maximise the service life of your conveyor belt cleaner is to use our Tungsten Carbide Tips.

Uses

Our tips are designed for H, P and T belt cleaners used on spliced belts with good belt cover. If you have belts with running mechanical fasteners talk to us about alternative solutions.

TYPES

H Tip

P Tip

T Tip

BENEFITS

Tungsten Carbide Tips provide high levels of resistance to abrasion and maximum resistance to carbide corrosion in environments with high acid or salt.

The tips and fasteners are completely stainless steel.

Unlike painted or plated mild steel tips, stainless steel tip bodies will not corrode which helps with site maintenance.
